## Macrium Site Manager User Guide

---

**Version:** 2

**Date:** 15 June 2022

# Macrium Site Manager User Guide

Search

This guide describes the capabilities of Macrium Site Manager 8, and provides information on how to use it to configure and use Site Manager.

There are a number of sections to this guide, covering all areas from installation and use through to troubleshooting and integration with other products. The sections available are:

- [Introduction to Site Manager](#) - general overview of Site Manager, showing the basic concepts and elements involved
- [Interface Overview](#) - introduces the basics of accessing and getting started with Site Manager
- [Installation and Update](#) - how to install Site Manager and how to keep it up to date, including system requirements
- [Licensing](#) - how the licensing model works, what licensing is required and how to update licenses
- [Configuration and Security](#) - an overview of how security and networking is managed in Site Manager and the different configuration options available
- [Scheduling Centrally Managed Backups](#) - how to set up or modify a set of scheduled network backups in Site Manager
- [Monitoring and Management Tools](#) - how to use Site Manager to monitor scheduled backups and be notified about important events
- [Managing and Restoring Backups](#) - how to access backup files or restore computers from backup
- [Troubleshooting and Advanced Guides](#) - a set of troubleshooting guides covering common areas and problems encountered with Site Manager

## Introduction to Site Manager

### Overview

Site Manager enables backup, restore and monitoring of multiple networked computers running Macrium Reflect technology. The Site Manager server is installed as a Windows service on a server computer and may be accessed using a web browser user interface. Supported browsers are Google Chrome, Firefox, Microsoft Edge and IE 11.

A **Macrium Agent** is installed on each remote computer which then communicates via TCP/IP to a single installed instance of the **Macrium Site Manager Server**. This service also exposes an HTTP/HTTPS server service on a configurable port which enables web browser sessions to manage the **Macrium Agent** installed computers.

The Site Manager Server service can be installed on any single networked PC or Server. Both Domain and Workgroup networks are supported.

## Requirements and Installation

The **Macrium Site Manager** server can be installed on all Windows operating system from Windows 7 and later, 32 or 64 bit.

The Agent which runs on managed computers can be installed on any Windows operating system from Windows XP Service Pack 3 onwards.

A detailed installation guide for the server is available [here](#). Agent computers can be installed through the server either automatically or through manual install. More details on this process are available [here](#).

## Site Manager 8 - New Features

Site Manager 8 is now available - this release contains a lot of new features and improvements, with some of the highlights shown below

- Upgrade To Macrium Reflect 8 Backup Engine
- New Computer Management Tools
  - Redesigned Computers Page
  - Groups and Tags
  - Backup by Tag
- Intra-daily Backups
  - Intra-daily Scheduling
  - Streamlined Logs
- Improved Restore/Recovery Tools
  - Universal Rescue Media

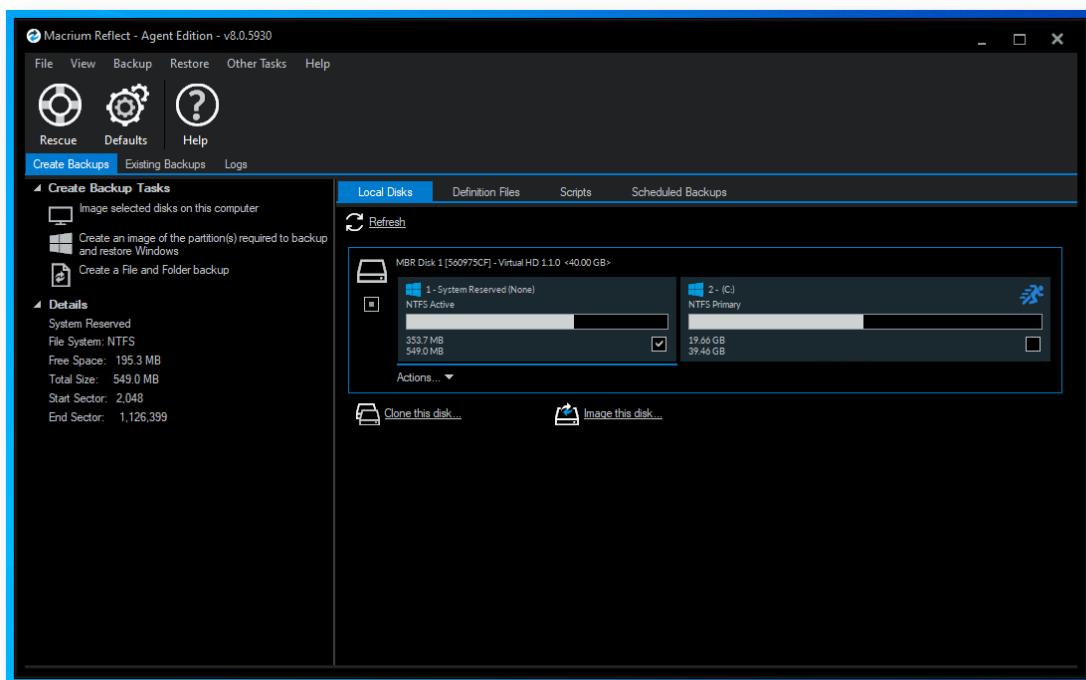

# Macrium Site Manager User Guide

- USB Creation Tool
- Improved Active Directory Integration
- Sync Repositories to Amazon S3
- Daily Data Export

There are many other bug fixes and improvements, a full list is shown in the Release Notes

## Upgrade To Macrium Reflect 8 Backup Engine

At its core, Site Manager 8 uses Macrium Reflect 8 technology to provide image and file based backups. This release brings in all the improvements and new features available in Reflect 8

A full list of the new features of Reflect 8 can be found in the [Reflect 8 Knowledgebase - New in Version 8.0](#)

## New Computer Management Tools

### Redesigned Computers Page

The Computers page itself has undergone a full redesign, improving performance, readability and function.

Additional information has been provided for each computer to help locate and identify problems in backup scheduling.

# Macrium Site Manager User Guide

## Groups and Tags

Computers can now be tagged and sorted into groups, giving the ability to break the computers page down into groups and dynamically filter it

# Macrium Site Manager User Guide

The image shows two screenshots of the Macrium Site Manager interface. The top screenshot is titled 'Groups and Tags' and displays two sections: 'Department' and 'Driver Signing'. The 'Department' section shows a table of tags (Accounts, Development, IT, Reception, Secret Laboratory) with their respective counts (4, 3, 5, 1, 3) and a 'New Group' button. The 'Driver Signing' section shows a table of tags (Not SHA2 compatible) with their respective counts (8) and an 'Add Tags' button. The bottom screenshot is titled 'Configure' and shows a detailed list of computer status. The left sidebar lists categories: Status, Department (Accounts, Development, IT, Reception, Secret Laboratory), Driver Signing, Agent Health, Agent Operating Mode, Agent Version, Backup Definitions, Computer Information, and Domain. The main table lists computers under 'Status' (Connected, Initializing, Disconnected, Reboot Required), 'Computer' (CLIENT26, CLIENT27, CLIENT28, CLIENT29, CLIENT30, CLIENT31, CLIENT32, CLIENT33, CLIENT34, CLIENT35, CLIENT36, CLIENT37), 'Status' (Connected), 'Windows Version' (Windows 7 (64-bit), Windows Vista (32-bit), Windows Vista (32-bit), Windows Vista (32-bit), Windows Vista (32-bit), Windows Vista (32-bit)), and 'Activity' (Image Backup at 05/26/2021 1:15:00, Image Backup at 05/24/2021 7:45:00, Image Backup at 05/24/2021 7:45:00, Image Backup at 05/24/2021 7:45:00, No Recent Activity, No Recent Activity).

Tags are also created automatically for some data including:

- Computer Status, OS and Agent version
- Backup Definition membership
- Active Directory information
- Last backup failures

# Macrium Site Manager User Guide

The screenshot shows the 'Configure' section of the Macrium Site Manager. On the left is a navigation tree with categories like 'Status', 'Custom Group', 'Department', 'Driver Signing', 'Agent Health' (selected), 'Agent Operating Mode', 'Agent Version', 'Backup Definitions', 'Computer Information', and 'Domain'. The main area displays a table of computers with columns for Computer, Status, Windows Version, Activity, and Tags. The table is filtered into three groups: 'Last Backup Failed' (7 computers), 'No Backups Scheduled' (36 computers), and 'No Recent Backups' (36 computers). Each computer entry includes a status icon (green checkmark for Connected, yellow for Initializing, red for Disconnected, blue for Reboot Required), the computer name, its Windows version, the last activity (e.g., 'Image Backup at 05/26/2021 1:25 AM'), and a list of tags. For example, 'CLIENT26' is connected and has the tag 'Last Backup Failed'. The interface includes buttons for 'Add', 'Delete', 'Install Agent', 'More Actions', 'Open Filters', and 'Download to CSV'.

See Groups and Tags for detailed information.

## Backup by Tag

Backup Definitions can now be based on tags - these backup definitions will update automatically as computers are tagged or lose tags

The screenshot shows the 'Backup By Tag Definition' interface. On the left is a sidebar with options: 'New Definition' (selected), 'Accounts Tag Backup', 'Backup By Tag Definition' (selected), 'Mix OS', 'Source Code Backup', and 'System Disk Backup'. The main area has a header 'Backup By Tag Definition' with buttons for 'Run Now', 'Copy', 'Edit', and 'Delete'. Below is a 'Tags' section showing 'Accounts', 'fabrikam.local', and 'Reception' tags. The 'Computers' section lists several computers with their status and partition matching results. The table includes columns for NetBIOS name, status, and partition matching status. For example, 'CLIENT26' and 'CLIENT27' are both marked as 'All partitions matched'.

This makes managing large groups of computers easier - just add a tag to the computer and it will automatically be pulled into backup scheduling. This includes tags based on Active Directory domain group information, allowing changes in AD to automatically update backup schedules.

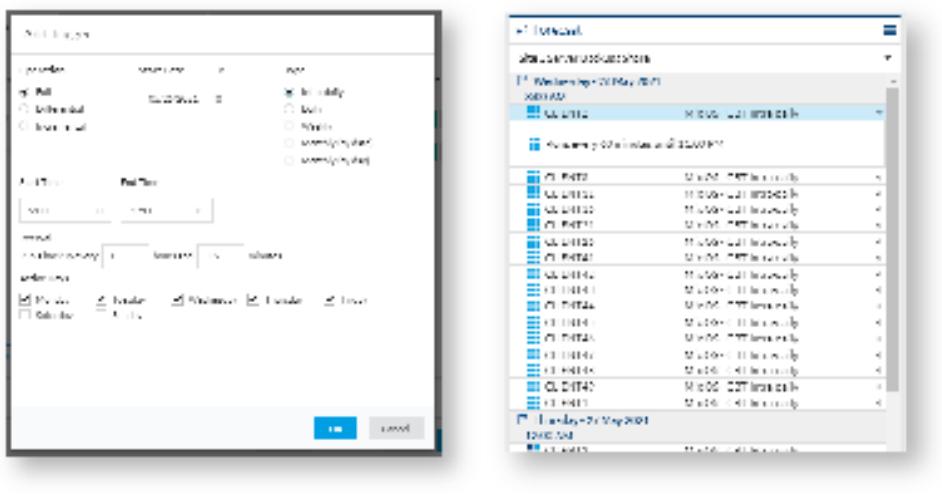

# Macrium Site Manager User Guide

## Intra-daily Backups

Reflect 8 introduced Intra-daily backups (see Reflect 8 Knowledgebase for more information), with additional tools to reduce the amount of messaging and logs around successful backups. Site Manager 8 contains the same tools and technology.

## Intra-daily Scheduling

Scheduled backups can now run as frequently as every 15 minutes in a time window.

## Streamlined Logs

As frequent intra-daily backups could cause a large number of notifications, logs and UI messages, a 'stealth mode' option has been added - it can be enabled on a per-schedule basis, and when it's in use, intra-daily backups that succeed don't report full backup logs. For these backups, the log view will show a daily summary table of intra-daily backups for each Agent.

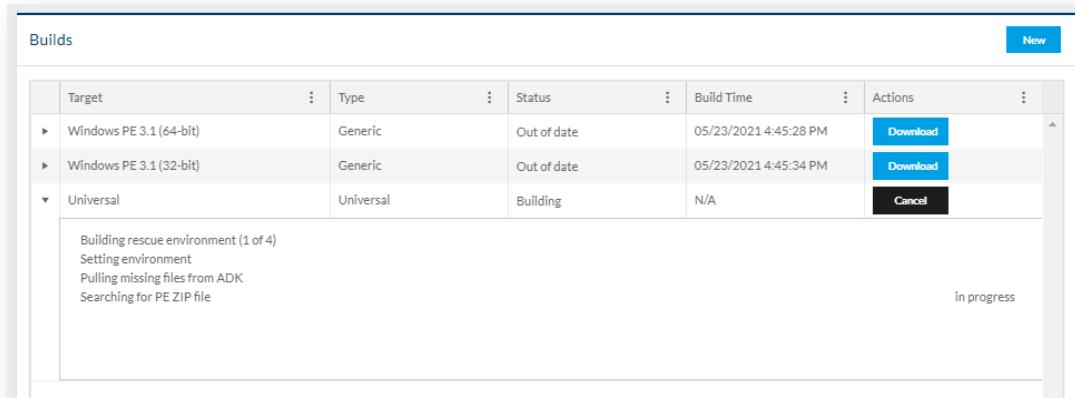

Logs					Export	Clear Filters	05/25/2021 1:04:29 AM - Image (CLIENT1)					Refresh Log
Computer	Date	Type	Result		Definition: MixOS Schedule: CBT intra-daily Repository: Site 3 Server Backups Share

# Macrium Site Manager User Guide

## Improved Restore/Recovery Tools

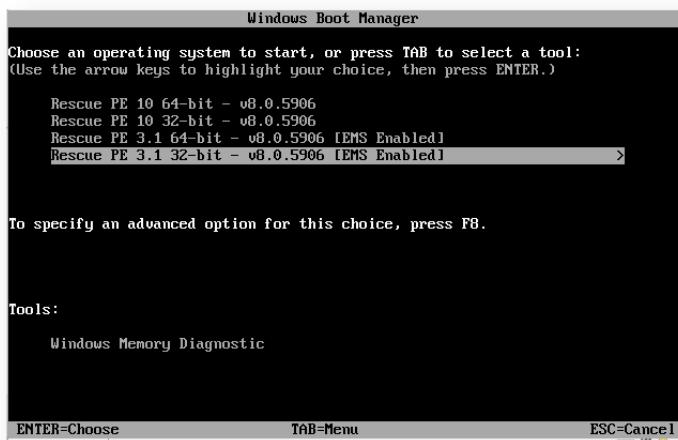

### Universal Rescue Media

Site Manager 7 has the ability to create Rescue Media - either for specific Agents or for a version of PE. This has been extended in Site Manager 8 with universal Rescue Media - this is a build of Rescue Media which contains all 4 PE versions and architecture combinations available in Site Manager, along with all drivers and static IP information for every Agent in Site Manager.

Target	Type	Status	Build Time	Actions
Windows PE 3.1 (64-bit)	Generic	Out of date	05/23/2021 4:45:28 PM	<a href="#">Download</a>
Windows PE 3.1 (32-bit)	Generic	Out of date	05/23/2021 4:45:34 PM	<a href="#">Download</a>
Universal	Universal	Building	N/A	<a href="#">Cancel</a>

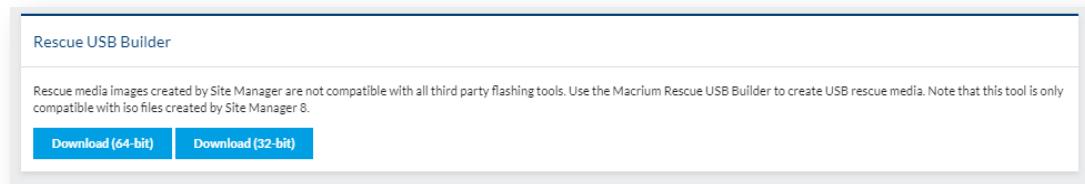

On booting from a universal Rescue Media ISO image, DVD or USB stick, the different PE environments are available in a boot menu

### USB Creation Tool

Site Manager produces ISO DVD image files for Rescue Media as the web interface means that it can't access any DVD drives or USB sticks attached to the computer. This has meant that it's been necessary to use third-party software to turn this ISO file into a bootable USB stick. Site Manager 8 provides a downloadable command-line utility for creating Rescue Media USB sticks from ISO images.

# Macrium Site Manager User Guide

Rescue USB Builder

Rescue media images created by Site Manager are not compatible with all third party flashing tools. Use the Macrium Rescue USB Builder to create USB rescue media. Note that this tool is only compatible with iso files created by Site Manager 8.

[Download \(64-bit\)](#) [Download \(32-bit\)](#)

[Back](#)

Once downloaded, the command line utility can be used to discover available USB drives and create Rescue Media with them

```
c:\tmp>RescueUsbBuilder_x64.exe --list
Title      : Removable USB Flash Drive
Name       : SanDisk Cruzer Blade USB Device
Device Number : 3
Description : SanDiskCruzer Blade - H: MACRIUM_PE - 28.65 GB
Manufacturer : (Standard disk drives)

c:\tmp>RescueUsbBuilder_x64.exe --create --iso universal.iso --device 3
Title      : Removable USB Flash Drive
Name       : SanDisk Cruzer Blade USB Device
Device Number : 3
Description : SanDiskCruzer Blade - H: MACRIUM_PE - 28.65 GB
Manufacturer : (Standard disk drives)
Device contents will be overwritten, continue (Y/N)? y
Creating rescue usb

Copying files to device: 100%
Rescue USB created.
```

## Improved Active Directory Integration

As part of the computers page improvements, Site Manager 8 has additional Active Directory information available.

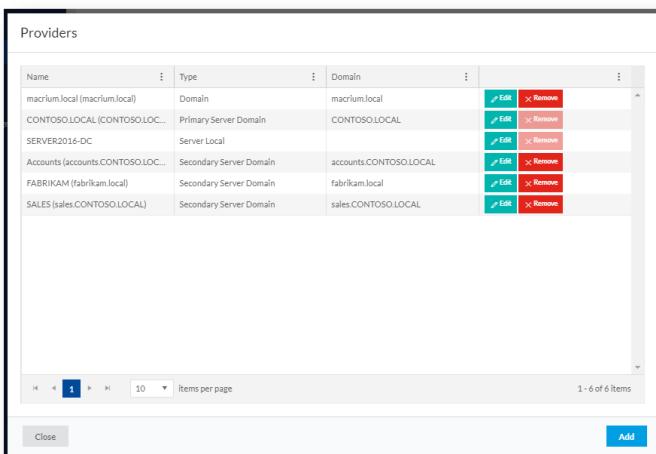

Agents now automatically send information on their Active Directory description and membership in any groups (OU, security and distribution groups across the whole AD forest) to the Site Manager server. These are displayed as tags in the computers page

# Macrium Site Manager User Guide

These tags can be used to sort, filter and include computers in Backup Definitions. If the group membership is changed in AD, the Agent will detect this and update the Site Manager server.

All domains in the Active Directory forest visible to the Site Manager server are now added as login providers automatically as 'Secondary Server Domains'

When logging in, all groups permissions are now resolved across the whole forest - so a user in Domain A can be allowed access to Site Manager based on a group permission in Domain B.

## Sync Repositories to Amazon S3

In addition to the existing FTP and network drive Repository synchronization available, Site Manager 8 has added sync to S3 compatible stores to help in replicating backup data into the cloud.

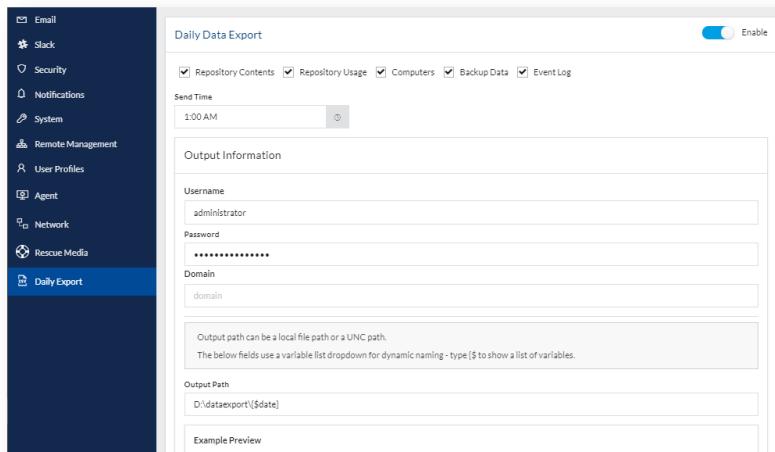

# Macrium Site Manager User Guide

Amazon, Wasabi and Backblaze configurations are provided, but any S3 compatible store can be configured. See [Remote Synchronization with Amazon S3 or Other Compatible Stores](#) for more information.

## Daily Data Export

To assist in custom scripting, ingesting Site Manager information into custom/third-party systems or auditing, Site Manager 8 now offers a daily CSV export of data which can be configured in **Settings**.

## Upgrading From Site Manager 7 to 8

- Introduction
- Licensing Changes
  - Agent Licenses
  - Standalone Licenses
  - Metered Licenses
  - Staying with Version 7

# Macrium Site Manager User Guide

- The Upgrade Wizard
- Upgrading in an Offline Environment

## Introduction

With the introduction to Macrium Site Manager 8, existing version 7 license keys must be upgraded to version 8 to be recognized in Site Manager 8. This article covers the changes to licensing and how to perform an upgrade to Site Manager 8.

## Licensing Changes

In Site Manager 8, any licenses must be version 8 licenses. Older licenses can be upgraded in version 7 Site Manager prior to update through the licenses page. When upgrading from version 7 to version 8, a wizard will guide you through the process of upgrading licenses as needed. In addition, licenses can be upgraded in Site Manager 7 ahead of the upgrade.

## Agent Licenses

If an Agent license has active support, it will qualify for a free upgrade to version 8. If it is out of service, renewing the service on the key will allow it to be upgraded. See the [Macrium Website](#) for more details.

Any trial keys are also eligible for upgrade.

License upgrade functionality will only be enabled when the Site Manager 8 release is available, as shown in the **About** page.

To upgrade a key outside the version 8 upgrade wizard, the Licenses page has an upgrade option for Agent licenses:

The screenshot shows the 'Licenses' section of the Site Manager interface. On the left, a sidebar shows categories: 'Summary', 'Licenses' (selected), 'Agent' (4), 'Standalone' (2), 'Computers', 'Unlicensed' (0), and 'Licensed' (5). The 'Agent' section is expanded, showing a table of Agent Licenses. The table has columns: 'Key', 'Licensed To', 'Key Type', and 'Validation Type'. The table contains five rows, with the last row (Key 58) having a checked checkbox in the first column. At the top of the table, there are buttons for 'Delete' and 'Upgrade'. The 'Upgrade' button is highlighted in red.

	Key	Licensed To	Key Type	Validation Type
<input type="checkbox"/>	67-	Trial	Workstation	Trial
<input type="checkbox"/>	50-	A	Metered	Online
<input type="checkbox"/>	57-	A	Workstation (Not for Resale)	Online
<input checked="" type="checkbox"/>	58-	A	Server (Not for Resale)	Online

If a single license is selected, the **Upgrade** button can be clicked and the Site Manager server will attempt to upgrade the license. The upgrade status will appear as a notification

# Macrium Site Manager User Guide

A license must be in the valid state to be upgraded. An internet connection is required to perform key upgrades.

Keys can be upgraded for offline use at the [Macrium Upgrade and Renewal Wizard](#)

## Standalone Licenses

As with Agent licenses, standalone Reflect licenses must be version 8 to be valid for Site Manager 8. Any version 7 keys will be marked as invalid and the Site Manager will require an Agent license for that Agent. Keys may be upgraded in the **Licenses Standalone** section of Site Manager. To be able to update a standalone key, the following conditions must be true:

- The key is a version 7 key
- The Agent is in the connected state
- The Agent version is at least 7.3.5920
- The standalone Reflect version is at least 7.3.5854

If a license is eligible for upgrade, the upgrade button will be live when selecting the license key;

A screenshot of the Site Manager interface. On the left, a sidebar shows the navigation menu with 'Licenses' selected. Under 'Licenses', 'Standalone' is shown with a count of 2. The main panel is titled 'Standalone Licenses' and contains a table with an 'Upgrade' button. The table has columns for Key, Computer, Description, and Key Version. Two rows are listed: one for 'CLIENT1' with 'Example Description' and '7' as the key version, and another for 'EXCHANGE-2013' with the same details. The 'Key' column for the first row has a checked checkbox.

## Metered Licenses

Metered license keys are always considered the latest version - existing metered license keys will be detected as version 8 keys and no action need be taken to upgrade them.

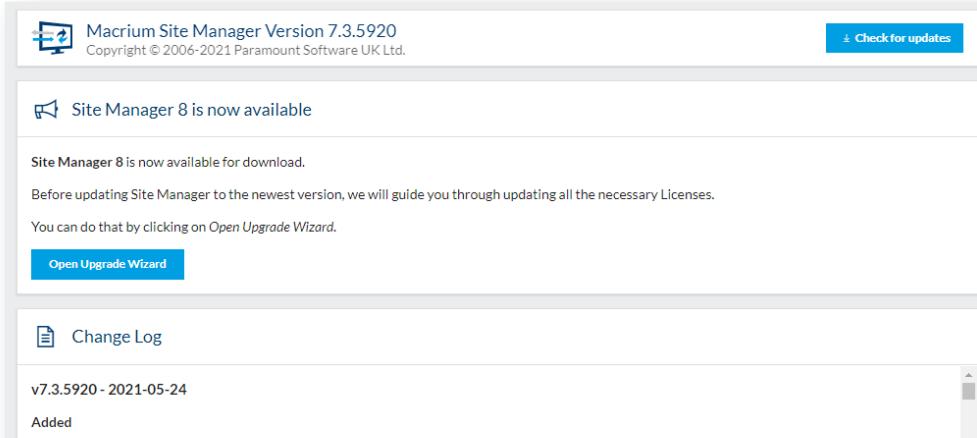

## Staying with Version 7

If you do not wish to upgrade to version 8, Version 7 will remain supported and receiving bug fixes, which will be delivered via the normal upgrade mechanism. Site Manager 7.3.5920 and greater can accept version 8 keys as Agent and standalone keys.

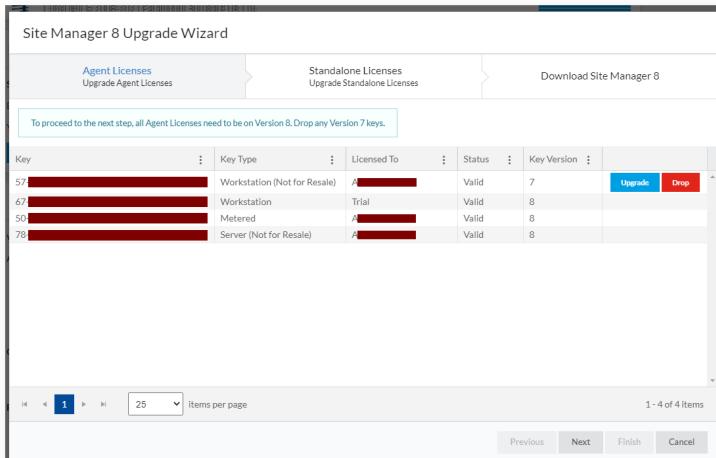

# Macrium Site Manager User Guide

## The Upgrade Wizard

When Site Manager 8 is released, Site Manager 7 will generate a notification that the release is ready and the **About** page of Site Manager will have the option to perform an upgrade

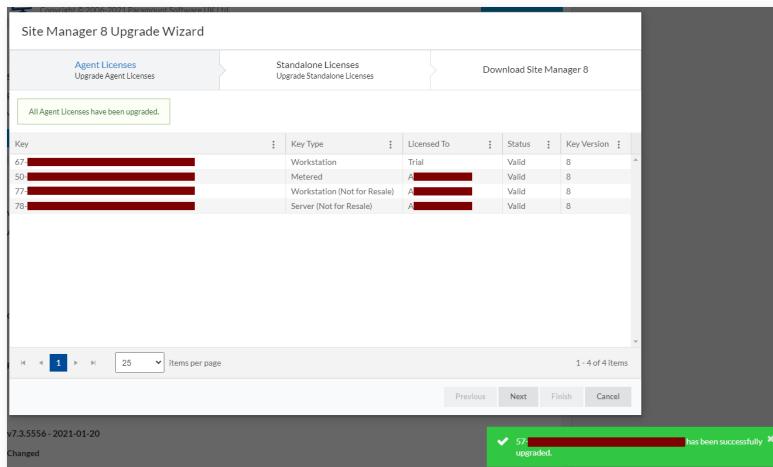

Clicking **Open Upgrade Wizard** will open the wizard to upgrade all licenses and start the upgrade process

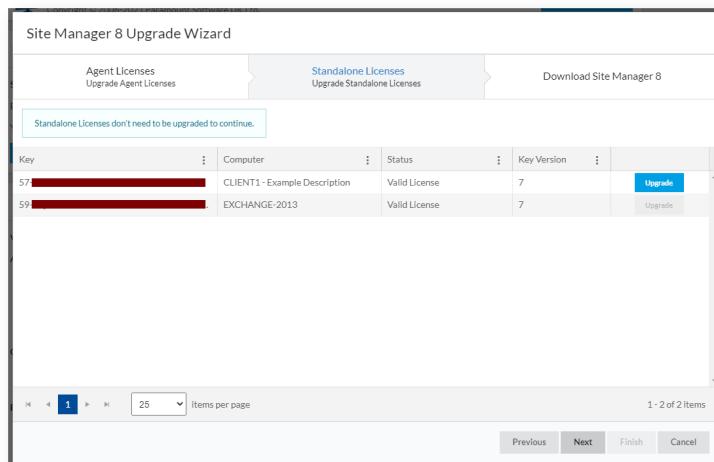

In the first stage, Agent licenses must be upgraded - any version 7 licenses must be upgraded or dropped to continue.

Once each license is upgraded or dropped, the UI will indicate that all licenses are valid and allow you to continue to the next stage

# Macrium Site Manager User Guide

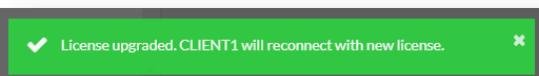

The next stage allows the optional upgrading of version 7 standalone Reflect licenses

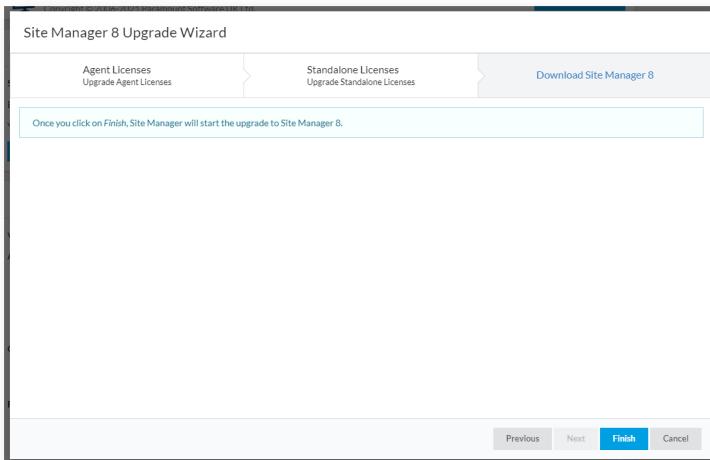

Here you may choose to upgrade standalone licenses - standalone licenses are not valid for use in Site Manager 8 and any version 7 licensed Agent will require an additional Agent license to operate.

Upgrading a standalone license will cause the Agent to reconnect with the upgraded license:

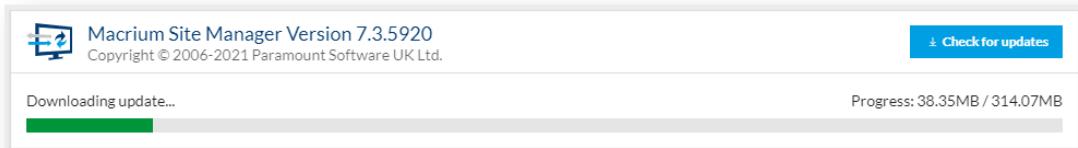

Once you click on next, the final page is displayed:

# Macrium Site Manager User Guide

Clicking **Finish** here will close the wizard, start the download of the Site Manager 8 installer and upgrade the Site Manager

## Upgrading in an Offline Environment

In an offline installation of Site Manager, the online upgrade tools and wizard won't work as they require an internet connection. In this case, the following procedure should be followed:

1. Visit the [Macrium Upgrade and Renewal Wizard](#) website to upgrade keys as needed
2. In your Site Manager, add the newly upgraded Agent keys
3. Remove the old version 7 keys
4. Upgrade any standalone Reflect installations on the Reflect computer directly
5. Download the Site Manager 8 installer and run on the server. This will perform an upgrade install

## Release Notes

### Site Manager 8 Release Notes

8.0.6503 - 2022-01-12

#### Added

- Added Windows Server 2022 version to Computers page display.

# Macrium Site Manager User Guide

- Added support for proxy servers to MultiSite connection (HTTP/S with CONNECT or SOCKS)

## Changed

- Update Agent backup engine to Macrium Reflect 8 version 8.0.6392. See [here](#) for details
- Improved the MultiSite Remote View connection to be faster and more reliable
- Added TCP keepalives to Agent connections to improve behaviour when connecting via NAT routing or firewall
- Added re-evaluation of any Agent user scripts before connection and on hardware/IP change to facilitate VPN detection

## Fixed

- Fixed extensive startup delays for clients with 50+ inaccessible domain providers.
- Fixed crash dump cleanup code not removing some old crash dumps
- Fixed unusual crash on startup when Windows takes over 10 seconds to bind a listen socket during Windows startup
- Fixed bug causing multiple event log events when an Agent with an active backup disconnects
- Fixed MultiSite Remote View of the licenses page not working

## 8.0.6305 - 2021-11-01

### Added

- Added "Reset VSS" feature to *Computers* page under the *Tools* tab for each computer. This can be used to restart and repair VSS on the remote computer.

### Changed

- Update Agent backup engine to Macrium Reflect 8 version 8.0.6161. See [here](#) for details
- Add additional support logging
- Renamed options in *Add Computers* wizard so that two entries no longer have the same title

### Fixed

- Fixed error preventing the computers page from loading due to control characters embedded in backup failure messages
- Fixed the Repository browser and restore pages encountering issues with backups made on systems with non-capitalized NetBIOS names
- Fixed issue with the scheduler calendar displaying incorrect times for unusual weekly triggers where intervals were greater than 1 and the first backup happened in the week after the start date.
- Fixed some MultiSite connectivity issues

## 8.0.6078 - 2021-08-09

### Changed

- Update Agent backup engine to Macrium Reflect 8 version 8.0.6036. See [here](#) for details

# Macrium Site Manager User Guide

- Updated installer to not wait for service startup to prevent rollback on timeout
- Improved performance getting log details with MultiSite
- Improved performance with large numbers of Agents (Over 300)

## Fixed

- Updated Remote Sync to take deletions into account when checking for appropriate disk space on the target
- Fixed deferred backup jobs running for computers that have never connected since the Site Manager service started up
- Fixed MultiSite API key changing when Network MAC addresses change too frequently - this was due to overly-eager hardware change detection
- Toggling scheduled backups on and off should no longer have long UI delays
- Fixed repeated passphrase change messages in the Event Log

## 8.0.6013 - 2021-07-05

### Changed

- Allow extra time for Agent Reflect to launch on slower systems
- Add extra logging for Windows time and time zone changes
- Detect Agents running on Windows 11 and update Windows Version tags to include Windows 11

### Fixed

- Removed spurious event log entries for failed configuration file loading when a file does not exist
- Fixed *Copy Path* function in Rescue Media page causing a JavaScript error
- Fixed default credentials not being used for Agent installs
- Fixed Remote Install working with default login credentials
- Fixed showing the user's display name in the top bar

## 8.0.5995 - 2021-06-22

### Changed

- Update Agent backup engine to Macrium Reflect 8 version 8.0.5994. See [here](#) for details
- Split logging for Active Directory, Driver and Agent events into separate files
- Added a Password Confirmation dialog in the *Settings > Email* page when attempting to send test emails
- Improved Active Directory query performance on Agents
- Updated Azure repository configuration credentials page to match non-Azure repositories

### Fixed

- Fixed emails not including backup log attachments or event name in the subject
- Fixed repository browser from preventing file deletion under limited circumstances

# Macrium Site Manager User Guide

- Fixed intra-daily backup success notification settings resetting to follow backup success notifications on service restart
- Fixed slow shutdown caused by service shutdown while a repository scan was in progress
- Fixed Agent taking a long time to shut down when huge numbers of backup logs are present on the Agent

## 8.0.5973 - 2021-06-10

### Fixed

- Fixed install failure on platforms which have never had a version 7 Site Manager Agent installed and which don't support SHA2 driver hashing
- Fixed Kerberos domain trusts causing a crash/hang in Site Manager server startup
- Fixed adding Metered license keys giving incorrect error message about upgrading
- Fixed the Scheduled Activity page always showing 'Active' button for Backup Definitions with no computers
- Fixed creating Backup Definitions without encryption producing a password length error
- Fixed the Agent not running on some systems on startup

## 8.0.5965 - 2021-06-07

### Changed

- Update Agent backup engine to Macrium Reflect 8 version 8.0.5963. See here for details
- Added extra code to delete write-test files on Repositories
- Added additional information to errors in the UI caused by JavaScript
- Changed intra-daily forecast to show intra-daily frequency as hours and minutes instead of just minutes
- Improved Scheduled Activity computer results table to show icons for all result types
- Added an option to use Repository credentials in the Restore wizard rather than pre-filling the credential fields
- Added an Revert button to the password field when editing the password in the Repository wizard
- Updated password fields to clear on click and use a fixed length of password characters to reduce any possible information leakage
- Updated Backup Definitions wizard to produce an error if the AES encryption type is changed to a type which requires a longer password
- Site Manager browser logout is now temporarily disabled during support log generation (ctrl-shift-s)

### Fixed

- Fixed Site Manager not allowing login via Microsoft accounts ([username@hotmail.com](mailto:username@hotmail.com) etc)
- Fixed backups being stuck in the running state in Scheduled Activity view if Site Manager is restarted during backup
- Fixed daily email not considering backups with warnings as successful when generating list of computers without backups

# Macrium Site Manager User Guide

- Fixed weekly triggers using an interval other than 1 from displaying the incorrect dates in the Schedules page in some cases
- Fixed the Scheduled Activity page always showing backup definitions with no computers as disabled regardless of slider selection
- Minor layout fixes on Licenses page
- Fixed Agent generating a warning that all backup sets have been deleted when using a 'Keep 1' retention rule and running the purge before backup
- Fixed the Computers page showing an 'Unlicensed' warning on computers using Virtual Machine Server Agent licenses
- Fix unusual crash if a background cleanup task triggers, runs and completes within 1 second of midnight
- Fix an Agent crashing on service shutdown if a log file changes during shutdown
- Fix missing ReflectTheme.dll in MIG component installation

## 8.0.5934 - 2021-05-26

### Added

- Update Agent backup engine to Macrium Reflect 8 and CBT release level (8.0.5928). [See here for details](#)
- Show clock and time zone information on the Site Manager header
  - All times shown in the UI should now be in the Site Manager server's time zone, not browser time zone.
- Intra-daily backups available in Schedules page
  - Intra-daily stealth mode (backup logs are not produced for successful intra-daily backups, a daily table of results is available in the Logs page instead)
  - Additional notification options for intra-daily backups
- New computers page
  - User-creatable tags
  - Automatic tagging for Agents with problems, Active directory information and backup definition membership
  - Sorting and grouping by tags
  - New detailed information for each computer
  - Backup by tag option in Backup Definitions
- Update wizard for adding new computers
  - Full Active Directory browsing to locate new computers
- Added Universal Rescue Media (a single rescue media with multiple PE versions to allow for a single USB which can restore any computer)
- Added USB creation tool to Rescue Media page - this allows a USB boot device to be created from an ISO image without third-party software

# Macrium Site Manager User Guide

- Added option to Remote Sync repositories to S3 compatible stores, including Amazon, Wasabi, Backblaze and any other manually configured S3 compatible server
- Added daily data export option to export CSV data from computers, licenses, backups, repositories (content and space usage) for audit and third-party integration purposes
- Dashboard updated to make status tiles clickable
- Added option to not show backup start/end notifications on Agents for scheduled backups
- Added option to use Wake-on-LAN in Run Now backups
- Added discovery and configuration of Domains in the same forest as the server's domain as login providers

## Changed

- Added code to detect SHA2 driver hash capability
  - Computers which cannot support SHA2 driver hashing will not have the CBT driver installed. If installed from an older Agent install, it will be removed on upgrade
  - The Site Manager server now required SHA2 driver hashing. Installing or upgrading a Site Manager server install will fail on these platforms
  - Microsoft hotfixes are available for platforms with these issues (Windows 7 and Server 2008 R2)
- More compact forecast display
- Computers page shows more detail on backups in progress
- Support upload (ctrl-shift-s) now allows download of support information in the browser
- Support upload (ctrl-shift-s) can now collect data from Agents directly
- Passphrase protected private keys can now be used for HTTPS certificates in the Site Manager server
- Changed Site Manager XML file names to look better in Backup Logs
- Updated repository connection code to show repository connection errors directly in Backup Logs
- Site Manager now sends IP addresses of Repositories on backup so that Agents which can't DNS resolve Repository names can use the IPs
- Added MAC and IP address columns to Computers page (hidden by default)
- Added Backup Comment column to Repository browsing, verification and remote restore pages
- Update columns in computers CSV export

## Fixed

- Fixed case where an IP address change was not synced to the Site Manager server from an Agent with multiple NICs
- Improve handling if a repository goes offline during a remote sync
- Repository browser now lists all computers with backup image files, even if they have since been removed from Site Manager
- Remote Syncs that end with a warning now show correct yellow status and icons in notifications
- Remote Sync in the dashboard progress widget will now say which Repository is syncing

# Macrium Site Manager User Guide

- Site Manager UI can show timestamps in a mix of Site Manager server time zone and Web Browser time zone - all times are now in the server's time zone

## Older Releases

For release notes for version 7.3 and earlier, see the [Archived Release Notes](#)

## Archived Release Notes

This page contains release notes for version 7.3 and earlier. Current release notes are available in [Release Notes](#)

### Site Manager Release Notes

#### 7.3.5920 - 2021-05-24

##### Added

- Site Manager 8 upgrade wizard added
- Version 8 license upgrade tools added
  - In the licenses page, version 7 license keys can be updated to version 8 if eligible.
  - Site Manager 7 will accept and use version 8 keys
  - Standalone Reflect licenses can be upgraded if the computer is running the latest version of the Agent and Reflect 7

##### Changed

- Update Agent backup engine to Reflect and CBT release level (7.3.5854). [See here for details](#)
- Improved Repository logging for support

##### Fixed

- Fixed issue where an SFTP remote sync could continue failing after network connectivity is restored
- Fixed Repositories not showing error status in the UI
- Improved performance for large numbers of Agents

#### 7.3.5556 - 2020-01-20

##### Changed

- Update Agent backup engine to Reflect and CBT release level (7.3.5555). [See here for details](#)
- Added Windows Server 2019 to possible Windows versions
- Add registry key to override Repository status polling frequency

##### Fixed

- Prevent VSS causing spurious hardware change detection and Agent reconnection during backups

# Macrium Site Manager User Guide

## 7.3.5390 - 2020-12-15

### Changed

- Added 60 second delay between an Agent coming online and allowing any backups to start. This is to reduce interrupted communication backup warnings when an Agent receives a security update after upgrade or has other communication issues
- Update Agent backup engine to Reflect and CBT release level (7.3.5365). See [here](#) for details
  - This update adds the option of using an internal scheduler for backups scheduled locally on the Agent. Users who have standalone Reflect should upgrade Reflect before converting locally scheduled tasks to this new scheduler. Centrally scheduled tasks are not affected.
- Added desktop and start menu icon for MIG
- Added registry key to bind management UI to a specific IP address
- Added registry key to disable local and domain administrators being able to login to Site Manager by default
- Reduced network timeout delays when adding offline license keys, updated UI to provide better guidance

### Fixed

- Fixed support expiry notices in the license page from displaying spurious information
- Fixed bug with network authentication during a restore which could cause a Site Manager Remote Restore to fail authentication in some cases where a Restore initiated from the Agent directly would succeed
- Fixed crash in Site Manager when attempting to verify two backups files where one file is a copy of the other
- Fixed scheduled backups failing a computer's backup instead of deferring that backup if that computer disconnected in unusual circumstances
- Fixed licenses page showing Agent license information from very old Agents as standalone licenses
- Fixed backup failures at an early stage (such as a File and Folder backup not matching any folders on the Agent) not triggering backup failure notifications
- Fixed bug where once one offline license key was added, the UI would not close correctly

## 7.3.5240 - 2020-10-05

### Added

- Site Manager Server now includes MIG (Macrium Image Guardian) to protect backup repositories hosted directly on the Site Manager server
  - For upgrades, MIG is not installed by default - after upgrade, the 'Modify install' feature can be used in the Programs Control Panel in Windows to install it.
- Added CPU priority and write rate limiting to Backup Definitions

### Changed

- Updated to CBT version 7.2.7114
- Added a status column to the Agent specific Rescue Media wizard to show which agents already have Rescue Media built.

# Macrium Site Manager User Guide

- Improved the driver load sequence in Windows PE/RE when multiple drivers for the same hardware is present
- Improved driver collection process to identify driver files which are stored in multiple locations on the Agent computer and reduce duplication
- Added 'Disk label' matching rules in Backup Definitions to allow easy blanket exclusions of virtual or special disks
- Added a longer timeout during the Remote Install process for computers which take more than 5 minutes to copy the Agent installer MSI from the server
- Improved error handling in Remote Syncs to make error conditions like the remote server being out of disk space clearer and to avoid unnecessary retries

## Fixed

- Fixed backup logs not being attached to success emails in all cases
- Fixed incorrect display when filtering the logs table for a computer which has no backup logs
- Fixed an issue where backup times could appear as midnight from some Agents installed on Windows in set to European system locales
- Fixed copying drivers from Agents failing for .inf files >2MB
- Removed unnecessary copying of USB drivers for USB controllers supported natively in Windows PE
- Fixed Using invalid domain names (.) causing remote install of an agent hanging
- Fixed changes to computer status causing options to uncheck themselves in the Restore wizard
- Fixed MIG protected repositories failing to delete dependent files when deleting a backup image in the Site Manager repository browser
- Fixed Volume and disk label matching rules in Backup Definitions not handling repeated spaces correctly
- Fixed shutdown hang caused by deadlock when sending emails during a backup finished notification while an Agent changes state
- Fixed service shutdown issue when running on a Windows debug kernel
- Fixed incorrect password entry dialog appearing when attempting to restore a password protected image
- Fixed multiple Remote Sync start notifications in some circumstances when a Remote Sync with the same time set for the start and end times is triggered while a backup is also running

## 7.2.5163 - 2020-08-25

### Fixed

- Fixed crash when using unusual proxy configurations

## 7.2.5161 - 2020-08-25

### Added

- Added Agent-specific rescue media

# Macrium Site Manager User Guide

- Critical drivers and static IP information are gathered automatically from Agents
- Rescue Media can be created on-demand for each computer with appropriate options and drivers included
- Drivers can be exported from Site Manager to allow for manual recovery
- Rescue Media build progress is now shown in the dashboard
- Drivers that have been manually added to Site Manager will be pushed onto computers during Remote Restore for cases where the host's own drivers are incompatible with Windows PE (Windows XP systems)
- Added FTP and FTPS support to Remote Sync
  - SFTP remote sync has been changed to *File Transfer*
  - *File Transfer* Remote Syncs can be configured to use SFTP, FTP or FTPS protocols
  - An option to override the default port used has been added
- Added option for log and event log retention in *Settings -> System*
- Added a *cancel*/option to the forecast for *Run Now* backups which have not started yet

## Changed

- Update Agent backup engine to Reflect and CBT release level (7.2.5107). [See here](#) for details
- Updated licenses page to be clearer
- Updated notification messages and reorganized notification settings
- Remove 25 character name limit on Backup Definitions and Schedules
- Updated OpenSSL libraries for fixes and SSL improvements
- Remote Sync windows which cross the midnight boundary (e.g. 11PM -> 3AM) are now supported
- Remote Sync results now show a more meaningful message when no changes were found
- Updated Slack integration to use the webhook API
- When adding computers by IP address, use Windows Networking to resolve names if DNS lookup fails
- Removed MSMQ dependency from Site Manager server - Agents which use the old MSMQ communications system (Version 7.2.4091 - March 2019 and earlier) are not longer supported
- Site Manager will recover partial or failed backups and consolidations automatically

## Fixed

- Fixed lock up when shutting down the Site Manager service with a Remote Sync in progress
- Fixed rare restore failure on Windows 7 due to network conditions
- Fixed spurious "Did not receive an end notification from Macrium Reflect" appearing before backup finish on some systems
- Fixed remote restore of password encrypted images failing with a read/write error
- Fixed Internet Explorer 11 display issues on the dashboard and other pages
- Fixed Event Log not refreshing when going back to the page after new log entries have been generated

# Macrium Site Manager User Guide

- Fixed activity popup on the computers page not showing the correct computer when multiple selection is used
- Fixed dashboard notifications not being in the correct order when events happen within 1 second of each other
- Windows PE downloads will now use the Site Manager proxy server settings
- Fixed inconsistent date formatting (DD/MM/YYYY vs. MM/DD/YYYY) when the user default locale differs from the system locale in Windows
- Fixed repository browsing showing no backup files for computers with an active backup in progress

## 7.2.4898 - 2020-05-11

### Fixed

- Fixed emails being rejected by some strict email servers since the 1st May 2020

## 7.2.4863 - 2020-04-27

### Changed

- Added internal retries to repository access during remote synchronization to improve robustness during long synchronization operations

### Fixed

- Fixed issue where some license keys could be saved into data files with trailing space characters, causing them to fail to validate
- Fixed license key checks happening continuously on a small number of systems with specific error conditions
- Fixed remote install problems on systems without Agent passphrases set
- Fixed Agent passphrase configuration appearing with neither option selected on the *Settings -> System* page under some circumstances
- Fixed Agent passphrases containing space and double quote characters not working with remote installation
- Fixed share authentication problems on the Site Manager interface which could occur when using a repository hosted on the same computer as the Site Manager server via IP address

## 7.2.4814 - 2020-03-27

### Changed

- Update Agent backup engine to Reflect and CBT release level (7.2.4808). See [here](#) for details
- Added new remote install mechanism, this removes the requirement for WMI firewall rules. The WMI mechanism is still used as a fallback if the new method fails.
- Improve support logging for restore, login authentication, remote sync and repository management
- Reduce default retry attempts for remote sync to a local folder target

### Fixed

# Macrium Site Manager User Guide

- Fixed issue where an Agent running on the same computer as Site Manager server could affect the repository status when a backup fails
- Fixed issue where the service does not shut down in a responsive manner when many license key checks are in progress
- Fixed issue where Site Manager would not scan image files in one repository folder when a backup was on progress in a different, unrelated folder
- Fixed login authentication incorrectly failing for accounts with empty passwords
- Fixed Active Directory login permissions manager not listing accounts whose primary group is not "Domain Users"

## 7.2.4709 - 2020-02-04

### Fixed

- Fixed issue with new and copied schedules reusing the same ID internally

## 7.2.4708 - 2020-02-03

### Fixed

- Fixed some backups from appearing as failures and triggering retry-on-fail rules incorrectly.
- Fixed Email error messages being truncated.

## 7.2.4700 - 2020-01-29

### Added

- Added ability to create rescue media ISO images from the Site Manager server.
- Added registry keys to disabled LDAPS when making Active Directory login requests.
- Added registry key to control network keep alive messaging rate for Agents behind NAT routers
- Added proxy server settings for internet requests to Site Manager configuration

### Changed

- Update Agent backup engine to Reflect and CBT release level (7.2.4601). [See here for details](#)
- Updated restore to use Windows PE10 build 1709.
- Improved pushing of PE files from the Site Manager server in a network isolated environment.
- Agent Configuration Tool will now succeed tests if the agent is already connected to the same server.
- Remove unnecessary network checks when adding multiple computers.
- Truncate extremely long backup error messages in the User Interface. Full errors are available in the logs.
- Force a repository cache database update on Remote Sync start to ensure the latest changes are always reflected.
- Improve Remote sync logging.

# Macrium Site Manager User Guide

- Improved logging for switching passphrases and connecting to passphrase protected agents. This should reduce agents stuck in the Unauthorized state.
- Updated Event Log clear option to be clearer.
- Added full path to details in repositories page.
- Made unbrowsable partitions in backup files unclickable in the browse interface.
- Updated all Windows authentication entry fields to correctly handle NetBIOS (DOMAIN\User) and DNS (user@domain.tld) entries in the username field

## Fixed

- Fixed issue where the Agent may attempt to connect to the incorrect IP address when DNS lookup returns a CNAME record
- Fixed some remote install failures appearing as successful in the user interface.
- Fixed computers page CSV export.
- Fixed UTF-8 decoding of localized error messages in backups.
- Ensure MultiSite connection is retried when waking from sleep.
- Fixed restores failing when restoring from a network share shared from the Site Manager server computer.
- Fixed lock ups caused by network timeouts attempting license key server checks.
- Fixed error preventing deletion of Remote Syncs.
- Fixed backups being prevented when a file named "c:\Program" exists.
- Fixed old scheduled backup failures appearing in daily emails.
- Fixed layout breaking when Site Manager web interface is displayed in a window less than 1650 pixels wide.
- Fixed Site Manager backup status being 'stuck' in computers table
- Fixed Event Log page displaying loading spinner forever if filtered to show 0 events

## 7.2.4479 - 2019-09-26

### Changed

- Update Agent backup engine to latest Reflect and CBT release level

### Fixed

- Fixed spurious Windows event logging happening on the Agent under some conditions
- Email addresses with labels are now accepted (e.g. John Doe <jdoe@example.com>)
- Fixed Agent updates failing on computers which have not been rebooted since the last Agent update
- Fixed computers which have been disconnected for extended periods of time from consuming license seats incorrectly
- Fixed emoji and other Unicode characters in supplementary planes not appearing correctly in email subjects
- Fixed slow shutdown caused by large numbers of repositories
- Fixed computer list corruption on restart under some circumstances

# Macrium Site Manager User Guide

## 7.2.4447 - 2019-08-28

### Added

- New \*Scheduled Activity\* view for configuring scheduled backups and remote syncs, moved from the Repository page.
- Added File and Folder type to Backup Definitions.
- Added ability to download multiple files and folders as a single ZIP file when browsing images.
- Creating desktop or start menu shortcuts is now an option in the Agent MSI installer user interface when manually installing.
- Remote Sync - Added option for backups to happen during the remote sync - they can only happen for computers which have had all their data transferred.

### Changed

- Remote Sync - SFTP file uploads which are interrupted will now attempt to resume the upload (up to 10 times).
- Remote Sync - Added option for backups to happen during the remote sync - they can only happen for computers which have had all their data transferred.
- Login - user accounts which are linked to an email (e.g. user@hotmail.com) may now use the email to login.
- File and Folder, Exchange and SQL backups are now shown in the Repository Browser and participate in Remote Sync.
- Updated look for Backup Definitions, Schedules, Repositories and Verification pages.
- When an agent disconnects from the Site Manager server while a backup is in progress, a new warning will be displayed instead of a backup failure.
- When Agents are updated, they will add or remove desktop shortcuts according to the setting in Site Manager.
- Failures to start scheduled backups are now shown in the email summary.
- Added additional code to ensure that network shares do not stay mapped on Agents after backups fail.
- Improved sorting and file display in the image browser, show NTFS junctions and links differently to normal files

### Fixed

- Fix rare configuration file corruption on service shutdown.
- Fix SFTP upload not handling spaces in paths correctly.
- Email - Fix GSSAPI authentication in SMTP causing spurious failures.
- Fixes for MultiSite connection not retrying after network drops.
- Fixes for system which are unable to contact Macrium MultiSite servers when running as a SYSTEM service.
- Fixed Agents being shown as having standalone Reflect even after standalone Reflect has been uninstalled.
- Fixed some timing based bugs in Agent comms where the Agent is retrying a dropped connection.

# Macrium Site Manager User Guide

- Fixed images manually stored in the root of a repository not being shown or remote synchronized.
- Fixed locking issues when browsing image files

## 7.2.4335 - 2019-06-19

### Changed

- Updated CBT driver to ignore the PortableBaseLayer virtual disk used by the Sandbox feature in Windows 10 build 1903
- Added retry on connection failure to file upload as part of repository sync

### Fixed

- Added additional code to reconnect agents with network issues
- Improved logging for image browsing failures

## 7.2.4314 - 2019-05-30

### Changed

- Added features to keep TCP traffic alive when passing through stateful firewalls and routers
- Added feature to prevent deletion of old backup sets if retention rules are set to "Keep 1 Full Backup" and the set of disks backed up changes

### Fixed

- Fix for being unable to communicate with a computer which has a lowercase NetBIOS name
- Fix Agent connections breaking when coming out of sleep
- Fix email bodies generating standards compliance errors in some gateways
- Fix email authentication *None* type not working
- Fix MultiSite data integration not providing all data under some circumstances

## 7.2.4290 - 2019-05-15

### Fixed

- Fixed email not working over SSL
- Fixed Remote sync not showing in the forecast in some circumstances
- Fixed backups staying in "immediate" status in some circumstances
- Fixed Agent incorrectly displaying an error about metered licensing
- Fixed login for domain users granted permission to login through a local group

## 7.2.4279 - 2019-05-10

### Fixed

- Fixed problem with authentication of domains which are child domains or part of a forest

# Macrium Site Manager User Guide

- Fixed Agent not sending appropriate progress messages under all conditions

## 7.2.4276 - 2019-05-09

### Added

- Added ability to grant non-Administrator users or security groups access to Site Manager
- Added ability to connect to non-joined Domains for login authentication
- Added CSV export to Computers page
- Added Agent Config Tool to test connectivity from Agent to Server
- Added option to disable automatic Agent updating
- Added option to Computers page to migrate Agents to another Site Manager

### Changed

- Changed Agent to Server communications to use TCP/IP sockets instead of MSMQ for flexibility and performance reasons. See [KnowledgeBase](#) for more details.
- Changed MultiSite integration to show status in settings page and support upcoming MultiSite changes
- Improve performance of repository checks and reduce number of login events in Windows Event Log
- Updated email sending to support TLS 1.1 and produce more readable errors
- Updated Macrium Reflect Backup components to latest release

### Fixed

- Fixed date not showing in Summary Email subject line
- Fixed Repository last synchronization times to display dates as well as times

## 7.2.4091 - 2019-03-13

### Fixed

- Fixed about page being blank for offline Site Manager installations
- Fixed crash when remote synchronization credentials become invalid

## 7.2.4075 - 2019-02-26

### Fixed

- Fixed standalone license keys not being read from some Agents
- Fixed license key table showing MAL licenses in the standalone license list
- Fixed drop-down selection on Run Now and Schedule Backup dialogs from sometimes failing to select the correct item

## 7.2.4000 - 2019-02-11

### Changed

# Macrium Site Manager User Guide

- Improved forecast performance with large numbers of scheduled backups

## Fixed

- Fixed issue with restore, validation and image browsing interfaces failing to validate image file passwords under some circumstances
- Fixed issue with restore failing with an error in "iLib::GenerateXMLRestore"
- Fixed email settings showing the incorrect options for encryption after a page refresh
- Fixed disk view in new definition dialog being broken by new Chrome version
- Fixed dashboard notification widget options interface not updating when it should
- Fixed an issue where building rescue media on a computer with both the Site Manager Agent and Macrium Reflect installed could fail

## 7.2.3985 - 2019-01-23

### Fixed

- Fix for VSS timeout errors on some systems
- Fix for Agent showing older Rescue Media creation interface
- Fix unusable dialog boxes when adding triggers on a smaller resolution screen

## 7.2.3971 - 2019-01-15

### Added

- Updated the Agent to use Reflect 7.2 technology including updated CBT drivers and WinRE based restore environment
- Added CSV export to license and event log pages
- Added clear event log facility
- Added Azure repository type
- Added default install credentials for remote Agent install to settings

### Changed

- Improved dashboard loading performance
- Improved forecast performance
- Updated event log page to improve look and performance
- Improved internal repository credential handling
- Made repository sync errors clearer

### Fixed

- Fixed issue preventing backups on some headless Windows Server Core systems
- Fixed Site Manager not using HTTPS-only cookies when configured to use HTTPS

# Macrium Site Manager User Guide

- Fixed Repository browsing not picking up changes when whole folders were manually deleted from repositories
- Fixed crash on startup when encountering corrupt image files

## 7.1.3778 - 2018-10-23

### Fixed

- Initial setup wizard was not setting HTTPS mode correctly
- Forecast view was not showing weekly triggered backups which have multiple days of the week selected

## 7.1.3720 - 2018-10-09

### Added

- Remote synchronization of repositories - a repository can now be configured to synchronize with an SFTP server or any Windows share (including Azure and AWS Storage Gateway) on a daily basis.
- Configuration backup and restore - from the settings page, Site Manager configuration can be backed up, downloaded and restored, to help disaster recovery or redeployment
- Added an option to set the description for a computer
- Added the Local Repository type. This repository type is to allow computers with locally attached storage to be backed up and managed by Site Manager

### Changed

- Adding computers will now not start the network scan automatically - in addition, there is a new option to list computers from a Windows domain server
- Adding a MAL license key when the Site Manager server will now prompt for an offline activation key instead of failing
- Improved Event Log and Backup Log performance

### Fixed

- Slack instructions now contain the correct link
- Removed older cryptographic cipher suites from HTTPS

## 7.1.3436 - 2018-07-24

### Fixed

- Fixed image browser returning "Unable to start PSMounterService" error

## 7.1.3420 - 2018-07-20

### Fixed

- Fixed last operation columns in computers view not displaying correctly
- Fixed repositories with no credentials showing the wrong status

# Macrium Site Manager User Guide

## 7.1.3396 - 2018-07-18

### Added

- New dashboard interface with resizable widgets and warning tiles
- New branding and colour scheme, including updates to side menus and tables
- Ability to open backups and download individual files from the browser
- Allow the number of days a computer has gone without a backup before a warning is added in the summary email to be set in the interface

### Changed

- Changed license checking code to recheck licenses more frequently if the check failed due to network issues, this should help reduce problems caused by temporary internet disconnections during Site Manager startup
- Improve loading times when starting up the interface
- Improve a number of UI components including time pickers
- Improve backup summary emails to include computers which are waiting to backup, computers which failed to start backups and other conditions which may need attention

### Fixed

- Fix a rare crash on server stop
- Fix backups not showing in the restore view if there are no repositories when the Site Manager service was started
- Fix deferred backups not being deferred correctly

## 7.1.3268 - 2018-06-13

### Added

- Option to install agents without creating desktop shortcuts
- Added pause and cancel buttons to detailed backup progress dialog
- Added ability of the agent to run a user-supplied script to disable backups (e.g. when on WiFi or VPN)

### Changed

- Improve computer name sorting
- Improve time display in time picker
- Additional Wake on LAN options for retry and timeout
- Improve Environment Check tool to be more flexible about different IP configurations

### Fixed

- Fix issue with being unable to edit the 'Test Recipients' field for email
- Fix issue with broken screen layout when editing schedule triggers multiple times on a smaller resolution screen/window

# Macrium Site Manager User Guide

- When restarting the server, paused backups should no longer be lost from the dashboard progress widget

## 7.1.3017 - 2018-03-29

### Added

- Implement metered licensing
- Wake on LAN option in schedules

### Fixed

- Agents which cannot receive communications from the server should no longer appear as managed in the UI
- Fix crash in restore PE environment when source image cannot be read
- Improve performance of the dashboard when large numbers of updates are happening
- Fix unauthorised agents generating unnecessary network communications
- Fix fortnightly schedules triggered close to midnight on a Saturday occurring on the wrong week
- Fix crash when removing an agent immediately after refreshing the agent status

## 7.1.2916 - 2018-02-27

### Fixed

- Fix exit to login screen on restore
- Fix email notification defaults not being applied until settings are saved

## 7.1.2910 - 2018-02-26

### Added

- New calendar view of schedules
- Email notification of individual events

### Changed

- License keys now require an internet connection on startup to validate
- Performance improvements
- Updated settings page to be more responsive
- Improve forecast display and performance

### Fixed

- Fixed retention rules not being applied to old backups when changing partitions in a Backup Definition
- Fixed case where remote install of agent could fail claiming computer is offline when it isn't
- Fixed memory leak when adding multiple computers with large numbers of backup logs simultaneously
- Fixed consolidation rules not being correctly applied when a Backup Definition is changed after backups have been taken

# Macrium Site Manager User Guide

- Fixed rare crash on login
- Fixed backup summary computer showing nonsensical numbers when a Site Manager has no computers
- Fixed rare instance of computers being lost from the dashboard on reboot
- Fixed agent version displayed in 'Programs and Features'
- Fixed performance issues when running with over 200 agents

## 7.1.2860 - 2018-01-24

### Fixed

- Fixed summary emails not appearing correctly on iPhones and other clients
- Fixed agent not logging events in the Windows Event Log correctly

## 7.1.2821 - 2018-01-08

### Added

- Added *Browse* capability the repositories
- Added function to delete backups from the repository browse feature
- Added network information diagnostic to the detail panel in computers view
- Added warning to agents which require a reboot for the CBT component to function
- Improved speed of file listing from repositories
- Added region selection to AWS Storage Gateway repositories
- Added new filters to Backup Definitions to exclude some disks/partitions from the backup
- Added computer health information to summary emails
- Added different computer icon to show which computers are Virtual Machines

### Changed

- Improved error handling for Repository connection errors due to network problems
- Improved performance with large numbers of agents
- Improved performance of agent related data requests
- Updated logos and icons
- Added warnings for deleting a Backup Definition which has been used to create backup images
- Added paging in restore and verify file lists to better handle large numbers of files
- Added icons for full, differential and incremental images to restore and verify tables
- Updated 'Unprotected Computers' dashboard widget to show more useful information
- Disabled cancelling of backups in places it's not valid to cancel
- Moved log resync function to details panel of the agent
- Improved performance with large number of active backups

# Macrium Site Manager User Guide

## Fixed

- Fixed issue where restore does not show backups from some NAS repositories
- Fixed issues where transient network errors could cause a repository to require manual intervention before reconnecting
- Fix issue with support upload uploading the wrong data
- Fixed confusing error when adding a version 7 upgrade key with a base v6 key fails
- Fixed spurious timeouts and backup failure messages happening when a verification operation takes an extremely long time
- Fixed license key upgrade dialog not being hidden correctly in some situations
- Fixed complex Backup Definitions with overlapping rules not backing up the correct backup set
- Fixed some display issues with selected months in Schedule triggers

## 7.1.2678 - 2017-11-06

### Fixed

- Fixed issue where computers with both the Agent and Site Manager server installed would generate large numbers of Windows Event Log events
- Fixed issue with verification page not allowing file additions
- Fixed issue with a crash on computers using third-party encryption tools

## 7.1.2657 - 2017-10-20

### Fixed

- Fixed Backup Definition rules becoming unavailable after creating a new Backup Definition
- Fixed Backup Definition wizard last page being incorrectly aligned
- Fixed monthly Schedule triggers not displaying the active months correctly

## 7.1.2625 - 2017-10-03

### Changed

- Central Management Console is now Macrium Site Manager
- Updated user interface, numerous fixes and updates
- Update license page layout
- Updated 'Unprotected Computers' dashboard widget to group computers and be clearer about errors
- Improved performance of user interface
- Agent backup technology is now based on Macrium Reflect 7.1 technology
- Site Manager is able to work with repositories protected with Macrium Image Guardian

# Macrium Site Manager User Guide

## Central Management Console Release Notes

### v6.3.1846 - 2017-09-29

#### Changed

- Internal changes to support upgrade to Site Manager 7.1

### v6.3.1844 - 2017-07-04

#### Changed

- Update 'Disk Image Insight' widget description to be more accurate

#### Fixed

- Fix a bug where an unauthorised computer can appear in the error state
- Fix broken Knowledgebase links

### v6.3.1833 - 2017-06-14

#### Added

- Interface and wizard to upgrade to version 7 of CMC when released
- Added facility to upgrade licenses to version 7 on both Macrium Agent Licenses and standalone Reflect licenses installed on agent computers
- All trial licenses will automatically be upgraded to version 7 licences
- Added 'Standalone Keys' view to 'Licenses' page, showing all computers with standalone licenses, whether they exempt the computer from consuming a MAL and an upgrade facility

#### Changed

- Agents which repeatedly fail to patch to the latest release will be flagged as having an error in the computers view. To fix this, perform a manual full install or remote full install on the agent
- Show additional information for Macrium Agent License keys such as support information and version
- Tidy layout of 'Image Status' widget

#### Fixed

- Starting a Run Now backup now updates the forecast immediately
- Macrium Agent Licenses which become invalid can now be removed
- Improve handling of unicode values in computer descriptions
- Fix cancelled backups having a duration of 0 seconds in summary emails

### v6.3.1791 - 2017-04-17

#### Changed

# Macrium Site Manager User Guide

- Improved backup performance in some cases

## Fixed

- Remote management integration fix
- Log view will no longer display a loading spinner forever when there are no logs or computers
- Scheduled backups can fail for systems with very large and complex disk configurations
- Fixed repository loading forever in some cases
- Fixed Environment Check tool to continue with checks if LLMNR broadcast IP check fails

## v6.3.1787 - 2017-04-10

### Added

- Added settings for remote management integration
- Added start date for schedule triggers

### Fixed

- Fixed bug where a month by day schedule trigger with multiple weekdays set would not show some days on the forecast
- Fixed bug causing backup errors on some systems with multiple simultaneous user sessions
- UI fixes for overlapping fields and button issues at some resolutions
- Fixed bug where a failed update download would require a server restart to recover

## v6.3.1773 - 2017-03-23

### Fixed

- Fixed edit definition dialog. Navigation buttons inaccessible
- Fixed edit retention rules. Fields overlap each other in Firefox and Edge

## v6.3.1769 - 2017-03-22

### Added

- Add Windows Event Log notifications - this can be configured in the Notifications section of the Settings view
- Added 'Last Activity Time' column to the Computers view. This column is hidden by default

### Changed

- Updated definition view to show computers which are fully and partially backed up more clearly and improve performance
- Improve performance of the computers view during heavy activity
- Improve performance of all views which list computers
- Improve performance when multiple simultaneous backups are being performed
- During restore, check that the image file was created from the computer which is being restored

# Macrium Site Manager User Guide

## Fixed

- Fixed rare issue where the dashboard would not come out of the 'initializing' state
- Fix multiple tooltips being on screen at once in the forecast view
- Fix update available pop-up message appearing while already downloading an update
- Fix some rare network logon issues during backup
- Fix scheduled backups not being updated when a computer is affected by licensing issues
- Fix issue where attempting to update a repository with incorrect credentials would take that repository offline
- Fix issue which caused the service to crash when stopped in service manager

## v6.3.1757 - 2017-03-10

## Fixed

- Repositories showing 'Unknown Error' in some conditions
- Improve Agent network handling

## v6.3.1750 - 2017-03-03

## Added

- Automatic logout of the console after period of inactivity (configurable in security settings)
- Additional logging for launching backup on remote agents

## Fixed

- Fixed issue where antivirus on a client could block backup and stall all scheduled backups
- Fixed issue where sometimes the dashboard would not leave the 'initializing' state

## v6.3.1738 - 2017-02-22

## Added

- Added drag and drop reorganisation of Dashboard widgets
- Added detailed progress log button to progress widget and Computers page
- Added additional information to the forecast to show which stage the backup is performing
- Added additional information to the backup progress widget to show backup source and target
- Added ability to set multiple agent passphrases simultaneously

## Changed

- Made notification of new Management Console versions more obvious
- Repositories with incorrect credentials now enter an error state instead of repeatedly retrying the credentials
- Schedules and Definitions in the 'Scheduled Backups' section of the Repository page are now links back to the appropriate page
- Added key version to the Macrium Agent License table in the Licenses page

# Macrium Site Manager User Guide

- Limited the number of notifications in the Dashboard notifications widget to 100 for performance reasons

## Fixed

- Added scroll bars to verification view when a large number of files are verified
- Fixed forecast display not updating when backups complete
- Fixed a scheduled backup hanging if it is run when another scheduled backup to the same computer is already in progress
- Fixed computers sometimes appearing as both 'Managed' and 'No Agent'
- Spacing on disk and partition tables in the computers view is fixed
- Fix issue with email not being sent in some circumstances
- Fix Definition page not showing the correct definition as being selected in the left hand menu under some circumstances

## v6.3.1713 - 2017-02-02

### Fixed

- Fixed issue where some log files were not limited in size
- Fixed issue where fields under settings would only show the numeric parts of mixed alphanumeric content

## v6.3.1708 - 2017-01-31

### Added

- Ability to rearrange dashboard panels using drag and drop.
- Update agent preinstallation to have a user interface and provide diagnostics on network and communications.

### Changed

- Updated remote installation of Agent software to distinguish between offline computers and computers with firewalled WMI components.
- Update startup sequence so that large numbers of agents are handled more efficiently.
- Remote installation of Agent software is now limited to 10 simultaneous installs to reduce network and system load. If more than 10 installs are requested, excess installs will wait until an earlier one completes before starting.
- Updated Amazon AWS Storage Gateway repositories to store local share information in the Storage Gateway, making re-adding AWS Storage Gateway repositories simpler.
- Improved computer view to no longer close menus during high update activity.
- Updated computer connection code to fall back to IP based message sending when communication cannot be established with an agent.
- Improved handling of domains in Repository create/edit interface

### Fixed

- Upgrading an agent now correctly blocks scheduled backups for that agent and vice versa.

# Macrium Site Manager User Guide

- Fixed email summary showing SQL and Exchange Backups as 'Image' backups.
- Fixes for validation on Settings page.
- Layout fixes for Internet Explorer 11.

## v6.3.1699 - 2017-01-16

### Changed

- General performance improvements.

### Fixed

- New widgets added to the *Dashboard* were not persisted in some cases.

## v6.3.1694 - 2017-01-11

### Added

- New security option to configure agent passphrase usage to simplify setting up and maintaining a deployment-wide security policy. Existing installations will generate a new random passphrase which can be seen and modified in the security section of the Settings page.

### Fixed

- Intermittent connectivity issues
- Corrected various UI text labels

## v6.3.1680 - 2016-12-26

### Added

- Number of Computers linked to a *Backup Definition* is now featured prominently in the UI.
- New Event Log events added for Email reports.
- Failed log files are now attached to Email Summary reports.
- Email Summary Reports can now show error messages.

### Changed

- Updated a 3rd-party UI library (*Contains several fixes & improvements*).
- Assorted minor UI improvements.

### Fixed

- Invalid data entered during *Restore* wizard could prevent progress through the wizard.
- Duplicate Email Summary reports being sent for some users.

## v6.3.1669 - 2016-12-15

### Added

# Macrium Site Manager User Guide

- CMC system restore will now copy required drivers from the client Windows OS for the PE rescue environment. This enables automatic system restores to cater for NIC and RAID hardware not natively supported by Windows PE.

## Fixed

- Problems with starting the Agent service on some Windows 7 32-bit computers. This has been resolved.

## v6.3.1666 - 2016-12-12

### Added

- Amazon AWS Cloud Storage Gateway integration. You can now associate an AWS Cloud Storage Gateway with a repository. This enables easy tracking of the upload buffer and other parameters provided by AWS.
- System image restore now copies static IPv4 assignments to the Windows PE rescue environment.
- When launching the Macrium Agent version of Reflect, if the Agent service isn't successfully communicating with the CMC then an appropriate diagnostic error message is now displayed.

### Changed

- New tabbed layout for the computers view makes fixing problem computers easier.
- New layout for the licensing view makes managing licenses more intuitive.

## Fixed

- Scheduled backups could run twice if the first backup was initiated a second prior to the scheduled run time. This has been resolved.
- SMTP server configuration was incorrectly setting 'Plain Text' authentication. This caused emails to an SMTP server without authentication to fail. This has been resolved.
- Summary backup emails could incorrectly report the backup duration by 1 hour.
- Many small bug fixes and enhancements.

## v6.3.1630 - 2016-11-15

### Fixed

- Backups could fail to authenticate against repositories causing the failure 'The user name or password is incorrect'. This has been resolved.

## v6.3.1629 - 2016-11-14

### Added

Backup Queue improvements:

- The 'Backup Now' function in Backup Definitions now queues jobs on the chosen Repository, reducing network flooding
- Schedules now contain a backup options section to improve the reliability of backups. This adds the following features:

# Macrium Site Manager User Guide

- Scheduled backups for offline computers may now be deferred until the computer is online instead of failing.
- A number of attempts can be set for failing backups. If a scheduled backup fails, it will be reattempted up to 10 times after the specified number of minutes has passed

## Summary Emails

- Column configuration, email sending time, and inline email view. Choose which columns appear in the summary email, preview the results and enter the time of day for automatic sending.

## Dashboard Widgets

- The 'Backup Status' and 'Computers' widgets can now be clicked to view the detail behind the numbers.

## Changed

- The verify view UI has been redesigned to make the verification steps more logical.
- License summary section is now more readable.
- Computer now have an 'Upgrading Agent' status.

## Fixed

- Backup forecast view could hang indefinitely when displaying the forecast. This has been resolved.
- IE11 compatibility Improvements.

## v6.3.1596 - 2016-10-21

### Initial public release of the Macrium Central Management Console (CMC)

The Macrium CMC enables backup, restore and monitoring of multiple networked computers running Macrium Reflect using a Web browser user interface. Supported browsers are Google Chrome, Firefox, Microsoft Edge and IE 11.

A Macrium Agent service is installed on each remote computer which then communicates using Microsoft Message Queueing (MSMQ) to a single installed instance of the Macrium Server service. This service also exposes an http server service on a configurable port which enables web browser sessions to manage the Macrium Agent installed computers.

## Interface Overview

### Accessing the Site Manager Interface

Once installed, the Site Manager interface is available via web browser. Chrome, Firefox, Edge and Internet Explorer 11 are supported. If this is the first time the Site Manager has been run on this computer, the security configuration profile selection screen will be shown. For more details, see [Installation and Update](#).

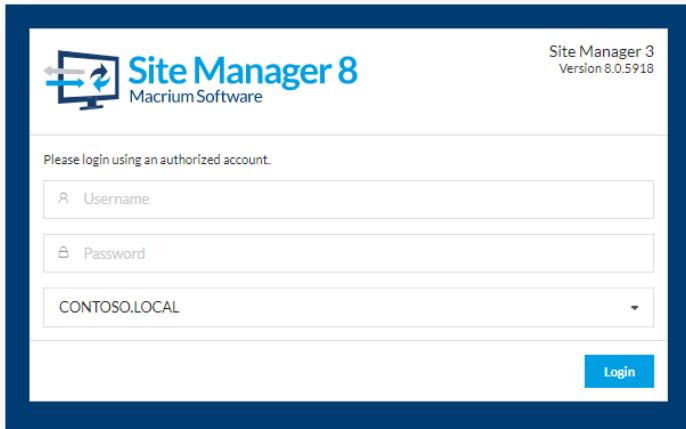

For the default simple setup profile, the Site Manager is accessible only from the computer it is installed on via **http://localhost:2904**

In the default secure setup, Site Manager is accessible from **https://<IP or DNS name>:2904**

# Macrium Site Manager User Guide

## Logging In

If Site Manager has been configured to require a login, the following screen will be shown:

Select a login provider to authenticate against its associated authentication resource. Some login providers are created automatically and enable domain and local administrators to login. More information can be in [Access Control](#).

If the Site Manager installation is not configured to require login, the dashboard page is shown instead.

## The Dashboard Page

The Dashboard page is shown after login:

The dashboard page is a comprehensive monitoring and management interface. It features a left sidebar with navigation links for Dashboard, Scheduled Activity, Site Configuration, Computers, Definitions, Schedules, Repositories, Restore, Remote Restore, Rescue Media, Other Tasks, Verification, Logs, Event Log, Licenses, Settings, and About. The main area is divided into several sections: 1) Notifications: A list of recent events, including 'Image started on CLIENT43' at 10:24:06 AM. 2) Computers: A chart showing the status of 35 connected computers, with a legend for Connected, Reboot Required, Disconnected, and Unauthorized. 3) Forecast: A table showing scheduled tasks for Saturday, 22 May 2021, and a list of active tasks for Sunday, 23 May 2021. 4) Image Status: A chart showing the status of images over the last three months, with categories for Successful, Failed, Warning, and Cancelled. 5) Activity: Two progress bars for 'Incremental Image' tasks on 'CLIENT2' and 'CLIENT21'. 6) Repository Disk Usage: A pie chart showing disk usage for Site 3 Server Backup Share, with 457.73GB used and 42.27GB free, totaling 500GB capacity. 7) Footer: Includes links to KnowledgeBase, Feedback, and Version 8.0.5918.

# Macrium Site Manager User Guide

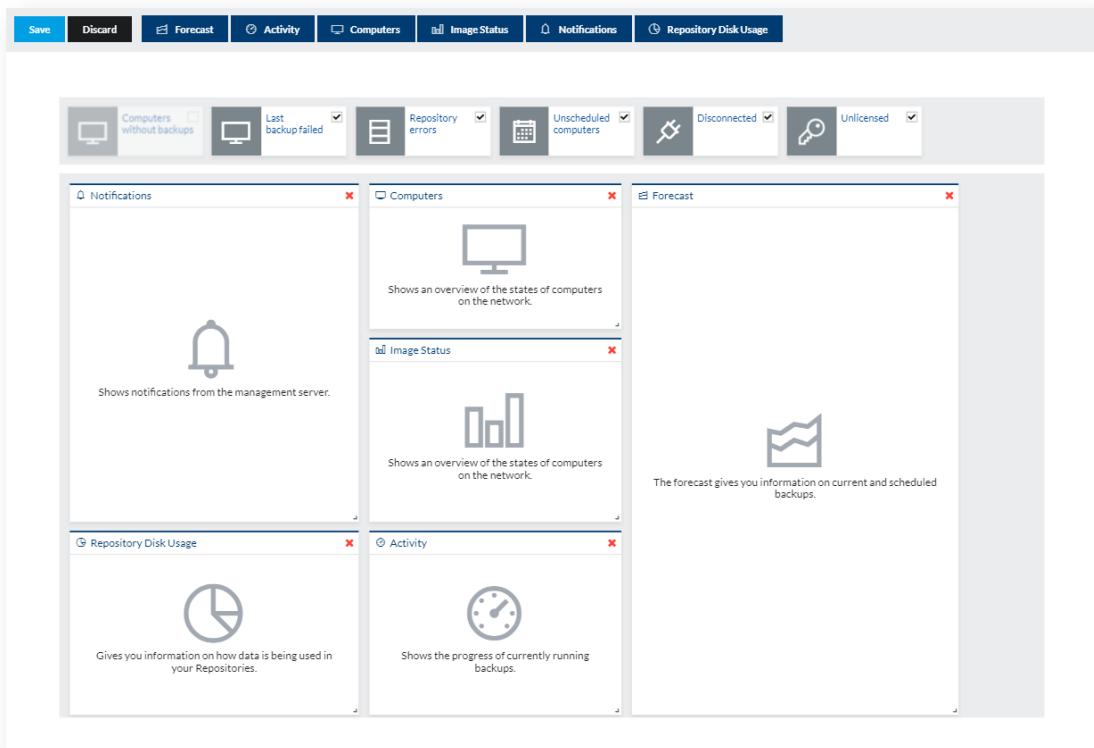

The Dashboard page shows a fixed set of warning tiles at the top, to indicate whether there are any items of concern in the Site Manager deployment and a number of different widgets to monitor the status of the Site Manager and connected computers. The overall layout of widgets and the configuration of each widget is stored on a per-user basis, so different users can set up their Dashboards in different ways.

The warning tiles are:

Warning Tile	Description
<b>Computers without backups</b>	Number of computers which have not had a backup created within the time limit specified in <b>Settings Notifications Backup Expiry Period (Days)</b>
<b>Last backup failed</b>	Number of computers where the last backup failed.
<b>Repository errors</b>	Number of repositories which are in an error state.
<b>Unscheduled computers</b>	Number of computers which are not part of a scheduled backup or have a locally scheduled backup in Macrium Reflect.
<b>Disconnected computers</b>	Number of computers which have been added to Site Manager but which are not currently connected.
<b>Unlicensed computers</b>	Number of computers which cannot backup because they don't have a valid license (either a standalone Reflect license or a server-assigned Agent license)

To edit the widget layout, click on the **Edit Dashboard** button on the top right of the screen. The Dashboard will enter edit mode:

# Macrium Site Manager User Guide

The top bar allows new widgets to be added to the Dashboard - clicking a button will add a widget to the Dashboard below the existing widgets. Multiple widgets of the same type may be added (e.g. adding two Repository Disk Usage widgets to show disk usage on two different repositories). The configuration may also be saved or changes discarded here.

Below this, individual warning tiles may be turned on or off.

In the large Dashboard area, the currently enabled widgets can be moved by dragging them, resized by dragging the resize handle on the bottom right or deleted by using the delete button on the top right.

The available widgets are:

Widget Name	Description
Forecast	An overview of any upcoming backups - may be configured to show different repositories or time periods
Activity	Progress bars and information for any currently backing-up computers.
Computers	Overview of the status of computers currently being managed, and their connection status.
Image Status	A bar chart of image results for a chosen time period.
Notifications	The events and notifications which have been generated by the management server, with tools to filter and delete them.

# Macrium Site Manager User Guide

Widget Name	Description
Repository Disk Usage	The free and used space on a repository, shown in pie chart format.

## Setup Pages

These pages are grouped under the 'Setup' heading in Site Manager and contain all the setup and configuration steps for [Scheduling Centrally Managed Backups](#).

## Computers

The Computers page manages the connected client computers of the Management Console and provides tools to add, remove and configure them.

## Backup Definitions

The [Backup Definitions](#) page contains definitions of what and how computers should be backed up. These definitions can be run manually or scheduled to run automatically:

# Macrium Site Manager User Guide

## Repositories

Repositories are locations which backup data is saved and managed. The repositories page can be used to create, manage and browse the contents of repositories.

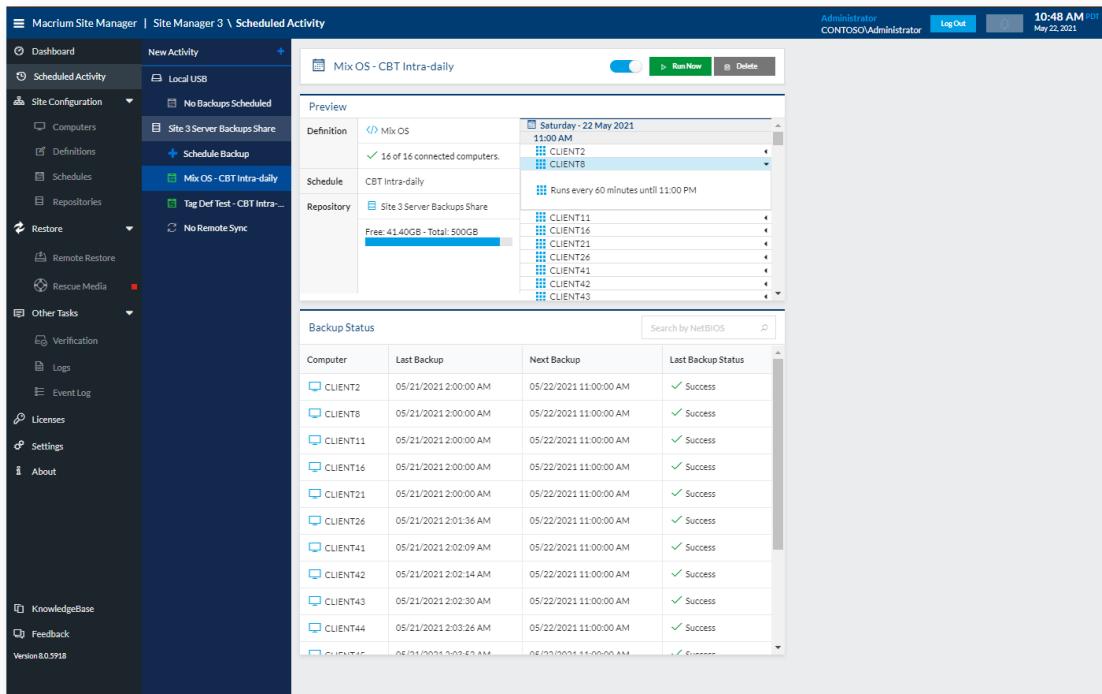

The screenshot shows the 'Repositories' section of the Macrium Site Manager interface. The left sidebar has 'Repositories' selected. The main area shows 'Site 3 Server Backups Share' with a pie chart indicating disk usage: Used 458.59GB, Free 41.40GB, Capacity: 500GB. Below the chart are configuration settings: Full Path (\server2016-dc\Backups), Free Space Threshold (Backup sets will not be deleted to maintain free space), and Simultaneous Backups (Up to 5 simultaneous backups). The 'Forecast' section shows scheduled activities for Saturday, May 22, 2021, at 11:00 AM, listing multiple client machines (CLIENT1 to CLIENT49) with the task 'Mix OS - CBT Intra-daily'.

## Scheduled Activity

The scheduled activity page controls all regularly scheduled backups and remote syncs defined by the other setup pages. This page can be used to schedule a backup definition to backup to a repository according to a schedule.

# Macrium Site Manager User Guide

The screenshot shows the Macrium Site Manager interface. The left sidebar includes options like Dashboard, Scheduled Activity, Site Configuration, Restore, Other Tasks, and Help. The main content area is titled 'Scheduled Activity' and shows a scheduled backup named 'Mix OS - CBT Intra-daily'. The 'Preview' section details the backup definition (Mix OS), schedule (CBT Intra-daily, Saturday - 22 May 2021, 11:00 AM), and repository (Site 3 Server Backups Share, Free: 41.40GB, Total: 500GB). Below the preview is a 'Backup Status' table with the following data:

Computer	Last Backup	Next Backup	Last Backup Status
CLIENT2	05/21/2021 2:00:00 AM	05/22/2021 11:00:00 AM	✓ Success
CLIENT8	05/21/2021 2:00:00 AM	05/22/2021 11:00:00 AM	✓ Success
CLIENT11	05/21/2021 2:00:00 AM	05/22/2021 11:00:00 AM	✓ Success
CLIENT16	05/21/2021 2:00:00 AM	05/22/2021 11:00:00 AM	✓ Success
CLIENT21	05/21/2021 2:00:00 AM	05/22/2021 11:00:00 AM	✓ Success
CLIENT26	05/21/2021 2:01:36 AM	05/22/2021 11:00:00 AM	✓ Success
CLIENT41	05/21/2021 2:02:09 AM	05/22/2021 11:00:00 AM	✓ Success
CLIENT42	05/21/2021 2:02:14 AM	05/22/2021 11:00:00 AM	✓ Success
CLIENT43	05/21/2021 2:02:30 AM	05/22/2021 11:00:00 AM	✓ Success
CLIENT44	05/21/2021 2:03:26 AM	05/22/2021 11:00:00 AM	✓ Success
CLIENT45	05/21/2021 2:03:30 AM	05/22/2021 11:00:00 AM	✓ Success

## Restore

### Remote Restore

The Restore page allows image stored in repositories to be remotely restored onto a managed computer in a simple manner. See Restoring an Image through Site Manager for details.

# Macrium Site Manager User Guide

## Rescue Media

This page is used to create and manage rescue media for disaster recovery. See [Rescue Media](#) for more information.

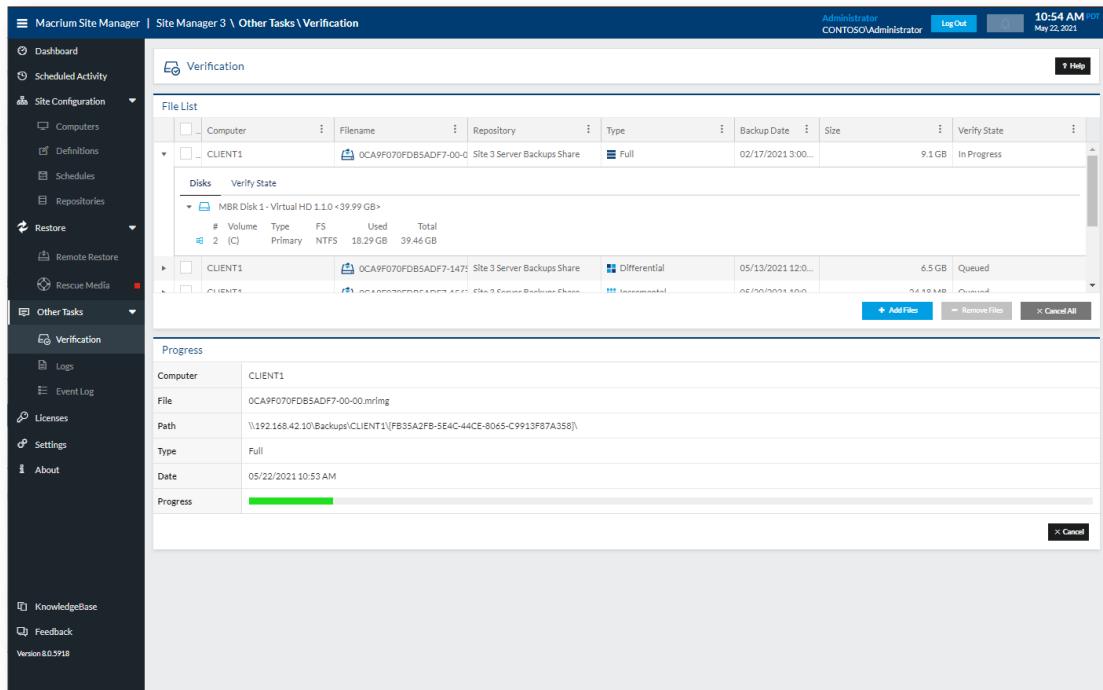

# Macrium Site Manager User Guide

## Other Tasks

These pages contain functions outside of setting up automated backups, restoring images or configuring Site Manager.

## The Verification Page

This page is used to verify the integrity of any backup images stored in your repositories. See [Verifying Backups](#) for more information.

The screenshot shows the 'Verification' page in Macrium Site Manager. The left sidebar is the navigation menu. The main area has a title 'Verification' and a 'File List' table. The table shows a backup for 'CLIENT1' in 'Site 3 Server Backups Share'. The 'Type' is 'Full', 'Backup Date' is '02/17/2021 3:00...', 'Size' is '9.1 GB', and 'Verify State' is 'In Progress'. Below the table is a 'Disks' section showing 'Verify State' for 'MBR Disk 1-Virtual HD 1.1.0 <39.99 GB>' and '2 (C) Primary NTFS 18.29 GB 39.46 GB'. At the bottom of the table are buttons: '+ Add File', '- Remove File', and 'Cancel All'. Below the table is a 'Progress' section with a table showing the progress of a task for 'CLIENT1' with file '0CA9F070FDB5ADF7-00-00.mrimg' at path '\192.168.42.10\Backups\CLIENT1\{FB35A2FB-5E4C-44CE-B065-C9913F87A358}'. The progress bar is green and nearly full. The progress table includes columns for Computer, File, Path, Type, Date, and Progress.

## The View Logs Page

The View Logs page is used to review backup history and gives access to all backup logs on connected computers. For more detailed information see [Reviewing Backup Logs](#).

# Macrium Site Manager User Guide

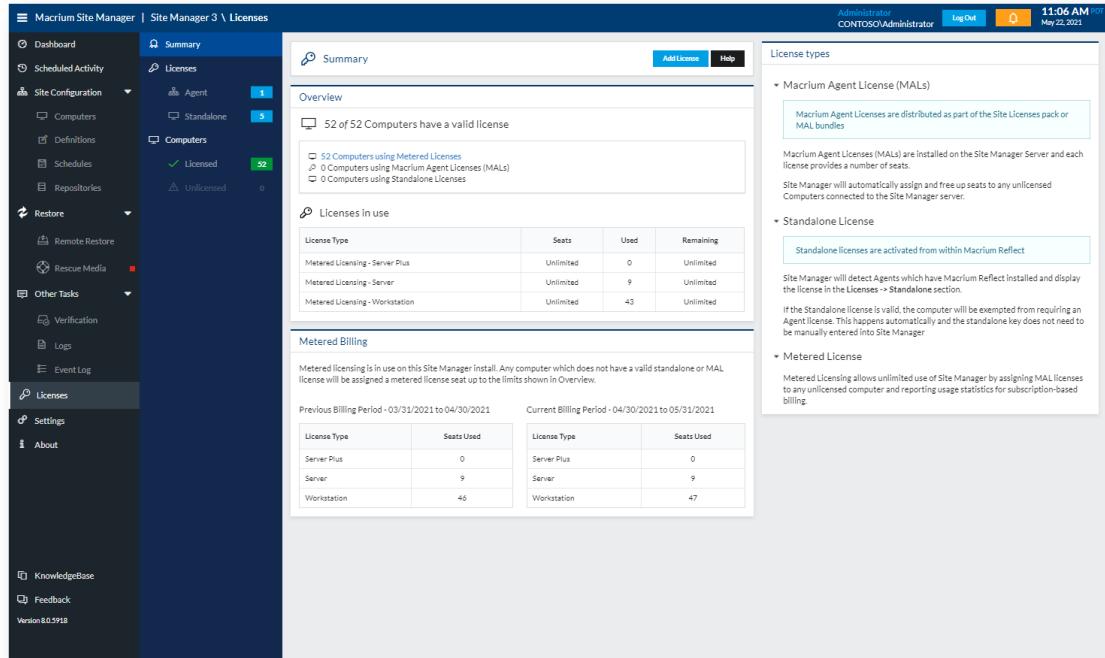

## The View Event Log Page

The event log contains a log of all the actions that have been taken in Site Manager and can be used to help review activity and audit the system. See [Reviewing Event Logs](#) for more details.

# Macrium Site Manager User Guide

## The Licenses Page

The Licenses page is used to display license information for connected clients and allow management of Macrium Agent Licenses to enable clients without standalone Macrium Reflect installed to be licensed and managed. See Licensing for more details.

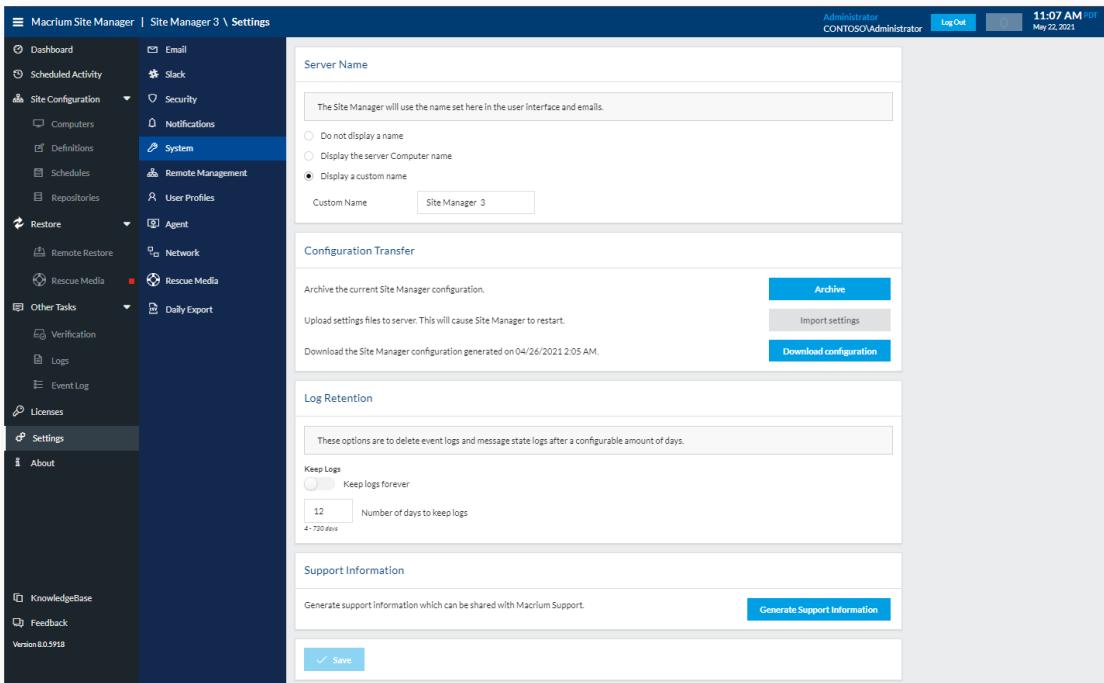

The screenshot shows the 'Licenses' page in the Macrium Site Manager interface. The left sidebar has 'Licenses' selected. The main content area has a 'Summary' tab selected. The 'Overview' section shows 52 of 52 Computers have a valid license. It details 52 Computers using Metered Licenses (0 using Macrium Agent Licenses (MALs), 0 using Standalone Licenses). The 'Licenses in use' section shows a table with three rows: Metered Licensing - Server Plus (Unlimited Seats, 0 Used, Unlimited Remaining), Metered Licensing - Server (Unlimited Seats, 9 Used, Unlimited Remaining), and Metered Licensing - Workstation (Unlimited Seats, 43 Used, Unlimited Remaining). The 'Metered Billing' section shows two tables: 'Previous Billing Period - 03/31/2021 to 04/30/2021' and 'Current Billing Period - 04/30/2021 to 05/31/2021'. The 'License types' section on the right details 'Macrium Agent License (MALs)' and 'Standalone License' (activated from Macrium Reflect). It also notes that Site Manager will automatically assign and free up seats for unlicensed computers. The 'Metered License' section notes that it allows unlimited use of Site Manager by assigning MAL licenses to unlicensed computers.

## The Settings Page

The Settings page contains settings for security, third-party integration and controls for features such as notifications. See Configuration and Security for more information.

# Macrium Site Manager User Guide

## Installation and Update

### Installing the Site Manager Service

The Site Manager service can be installed on any computer or Virtual Machine running Windows 7/Windows Server 2008 R2 or greater. As the service must be running to perform scheduled backups, it should be installed on a computer which is not turned off during these times.

#### ! SHA256 Driver Hashing

The Site Manager server uses driver components that require SHA-2 driver hashing. The Site Manager installer will fail on Windows 7 and Windows Server 2008 R2 unless an appropriate hotfix is installed. See [This Microsoft article](#) for more detail. Later versions of Windows support SHA-2 hashing natively and do not require any hotfixes.

#### i Download

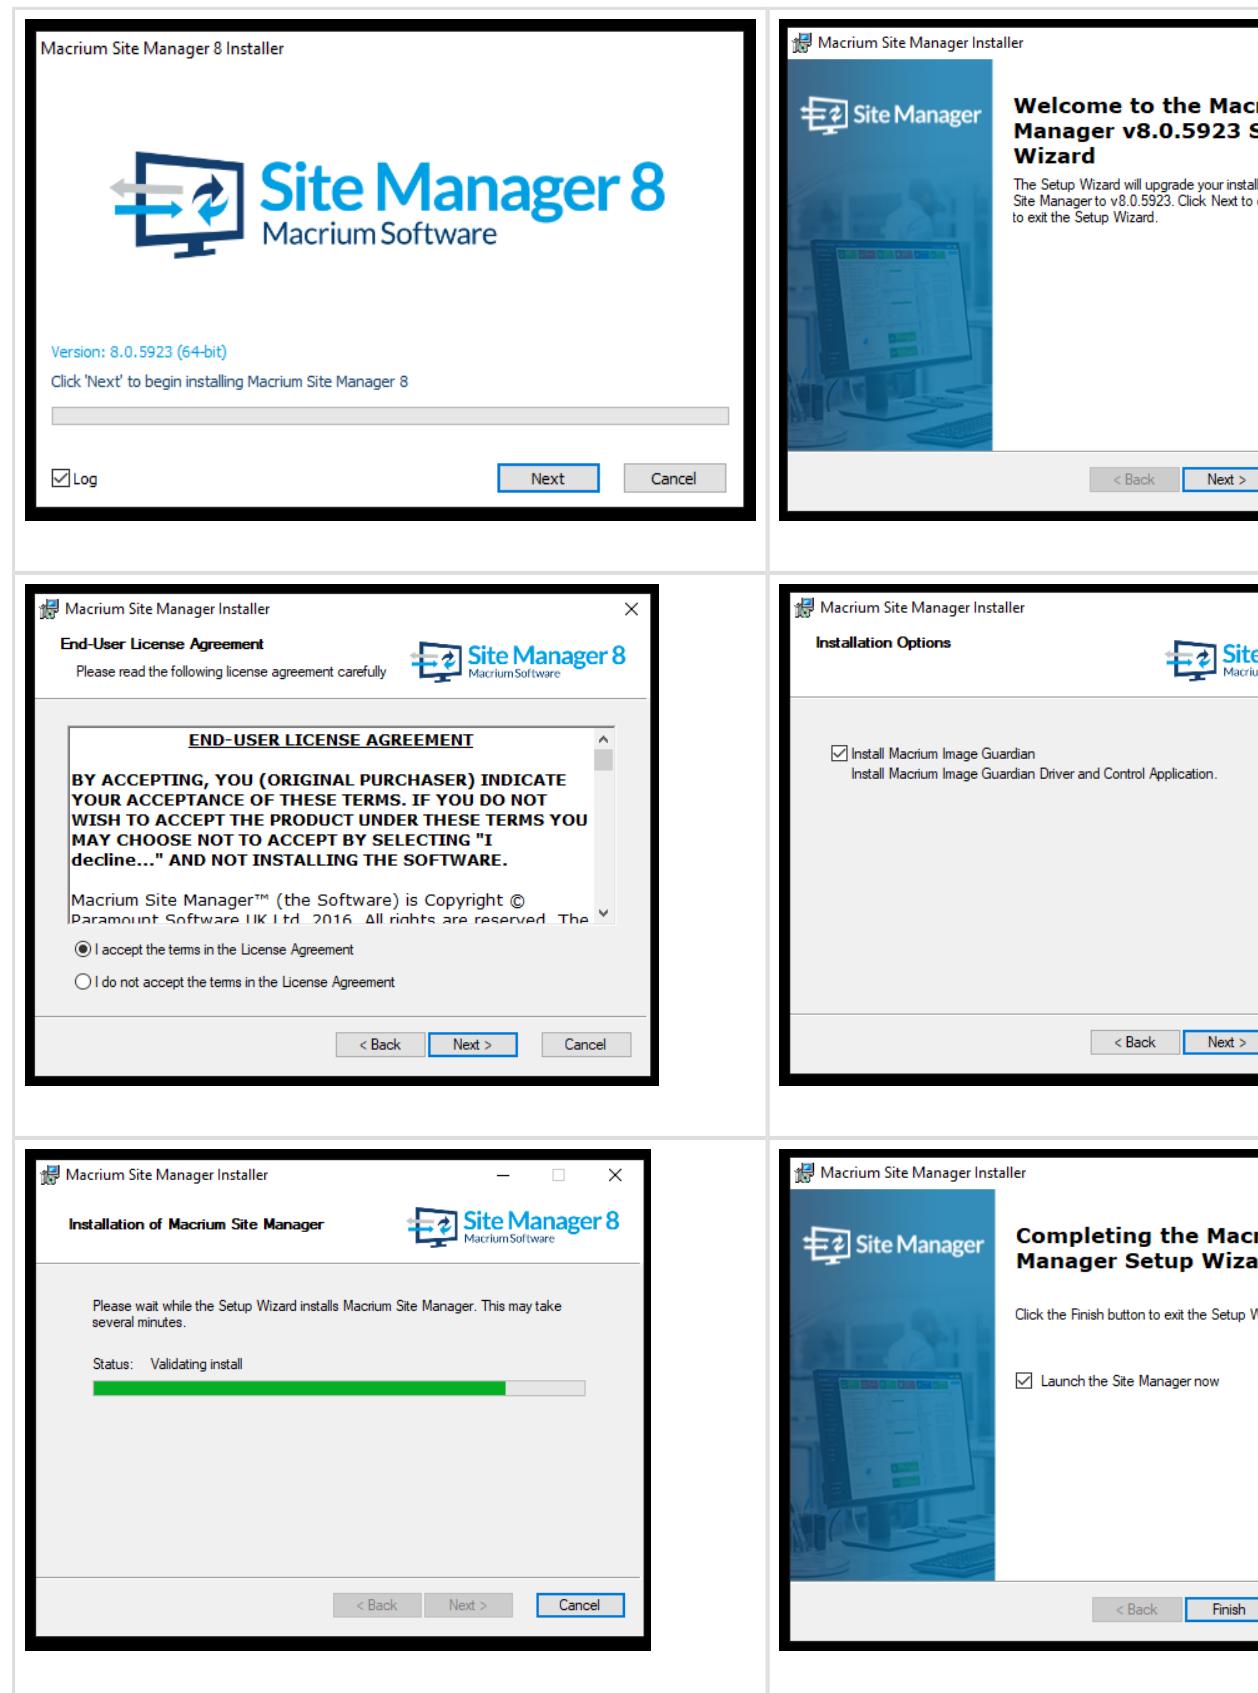

The Site Manager Server is available for download as either a 32-bit Windows Installer or a 64-bit Windows [Installer](#). The version installed must match the architecture of the Windows OS.

[Download Site Manager for Windows 64-bit](#)

[Download Site Manager for Windows 32-bit](#)

# Macrium Site Manager User Guide

The installer provides a standard install interface:

# Macrium Site Manager User Guide

## Install Options

During install, The following options are available:

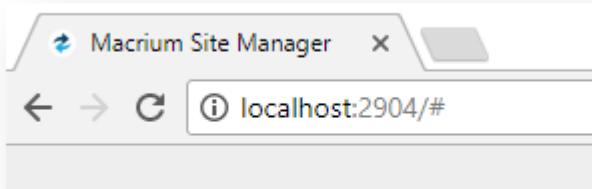

Option	Description
Install Macrium Image Guardian	If selected, the Macrium Image Guardian driver and configuration application will be installed with Site Manager. This can be used to provide additional anti-malware and anti-ransomware protection of Site Manager backup image files.  See <a href="#">Macrium Image Guardian</a> for more information
Launch the Site Manager now	If selected, a web browser will be launched with the Site Manager interface after <b>Finish</b> is pressed.

## Initial Configuration

Once installed use a local web browser to connect to the running server on the default port 2904. ( <http://localhost:2904> ).

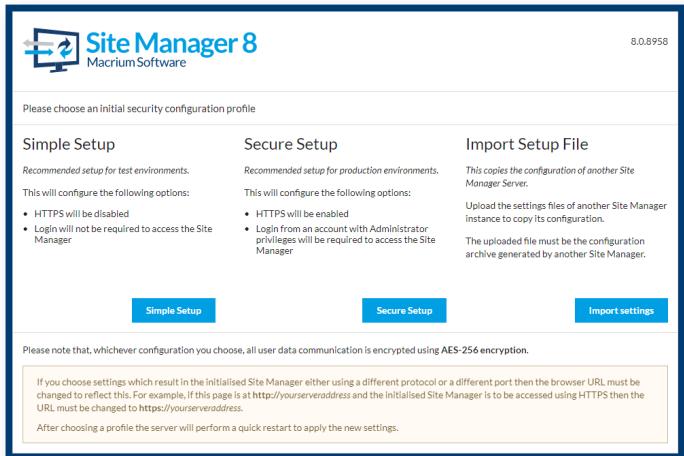

### Upgrade Installs

If you are upgrading from a previous installation of Site Manager, the protocol (http or https) and port will be set to the previously configured values

The first time you access the web interface, you will be prompted to select a security level to complete the security configuration:

# Macrium Site Manager User Guide

The recommended security level is **Simple Setup** for internal and test installations and **Secure Setup** for production environments. **Import Setup File** may also be chosen to import a saved configuration from another Site Manager server.

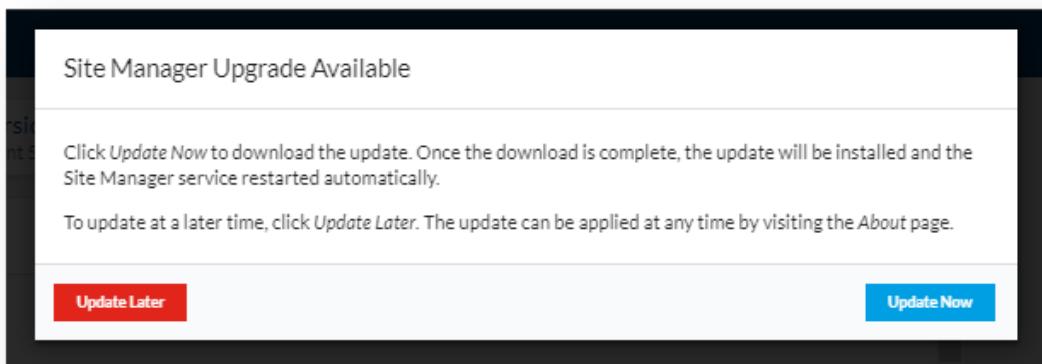

**Note:** These security settings may be changed at any time from the **Settings** page of Site Manager.

After selecting your security configuration Site Manager will immediately restart

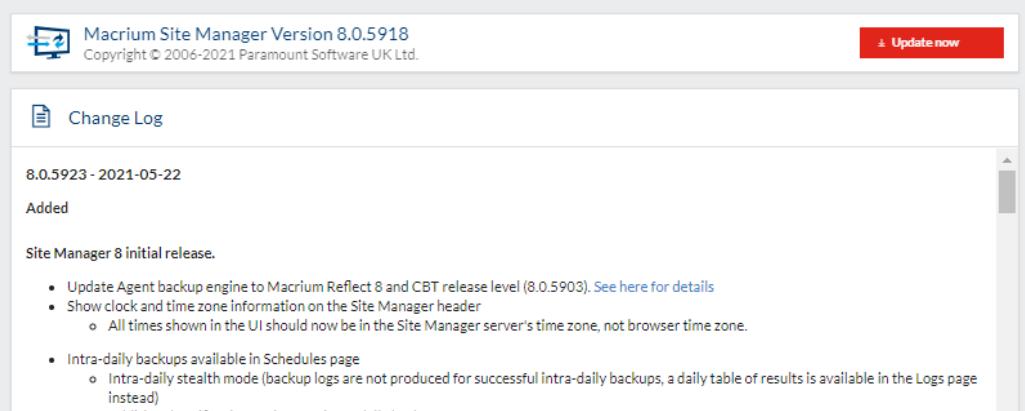

## Update

The Site Manager service will periodically check for updates with Macrium servers. If there is an update available, the following message will be shown on login:

If you click **Update Now** on this message or visit the **About** page, and click **Update Now**, a download of the Site Manager will start.

# Macrium Site Manager User Guide

Macrium Site Manager Version 8.0.5918  
Copyright © 2006-2021 Paramount Software UK Ltd.

Update now

Change Log

8.0.5923 - 2021-05-22

Added

Site Manager 8 initial release.

- Update Agent backup engine to Macrium Reflect 8 and CBT release level (8.0.5903). [See here for details](#)
- Show clock and time zone information on the Site Manager header
  - All times shown in the UI should now be in the Site Manager server's time zone, not browser time zone.
- Intra-daily backups available in Schedules page
  - Intra-daily stealth mode (backup logs are not produced for successful intra-daily backups, a daily table of results is available in the Logs page instead)
  - Additional notification options for intra-daily backups

When the download completes, Site Manager will apply it and automatically restart. When the Site Manager service restarts, it will update the individual agents which are connected. Any offline agents will be updated as soon as they connect to the Site Manager.

**i** Any backups in progress during the update will continue and the agent performing the backup will not be upgraded until the backup has completed.  
Due to the time and network traffic that upgrading causes, we recommend that upgrading the Site Manager is only done when there are no scheduled backups running.

## Licensing

### Overview

The Site Manager server can be installed and run with no license key or restriction on running. However, when adding computers to the Site Manager to be managed, each computer requires a license to be successfully managed.

There are two models for licensing - a license is deployed to the client computer as part of a standalone Macrium Reflect install or licenses can be added to the Site Manager server and dynamically allocated to client computers as needed. Licenses allocated in this way are called Macrium Agent Licenses

### Standalone Licenses

If a computer to be managed already has an installation of Macrium Reflect with a valid Macrium Reflect license, this computer can be managed by Site Manager with no further licensing required. The Site Manager will automatically detect that the client computer has a valid Reflect license when it connects for the first time after the agent has been installed - no configuration is necessary.

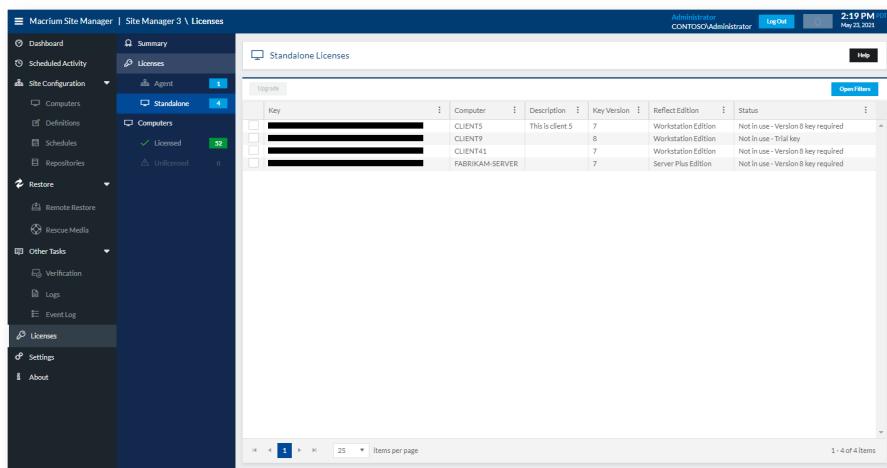

Managing computers with standalone Macrium Reflect licenses has the following benefits -

# Macrium Site Manager User Guide

- Ease of transition from managing computers individually to via Site Manager - no licensing changes are needed to start using Site Manager
- No dependency on Site Manager server - if a computer has a standalone license, then it will be able to run and use Macrium Reflect even if it cannot contact the Site Manager server. This is especially useful for laptops and other devices which are not always connected to the LAN
- Extended options for servers - Individual servers which have the Server Plus edition of Macrium Reflect can still use Reflect to conduct Exchange and SQL backups, even though these features are not included with the Macrium Agent License edition of Reflect.

Macrium Reflect 8 Home, Workstation, Server and Server Plus licenses qualify as valid licenses for Site Manager. Licenses earlier than version 8, Free Edition or any trial licenses are not valid.

Computers using standalone keys may be reviewed on the **Licenses Standalone** section. This shows all computers with standalone keys and whether they are valid for use within Site Manager:

Key	Computer	Description	Key Version	Reflect Edition	Status
CLIENT12	CLIENT12	This is client 5	8	Macrium Edition	Not In use - Version 8 key required
CLIENT19	CLIENT19		8	Workstation Edition	Not In use - Trial key
CLIENT41	CLIENT41		7	Workstation Edition	Not In use - Version 8 key required
FABRICAM-SERVER	FABRICAM-SERVER		7	Server Plus Edition	Not In use - Version 8 key required

License keys can be upgraded by selecting the appropriate license and using the **Upgrade** button. This will check a version 7 key with Macrium license servers and if the key is eligible for upgrade, the key will be upgraded and set on the Agent computer, so that it appears in Reflect. For this function to be available, the following conditions must be met:

- The computer must be running the most recent Agent version
- The computer must be running at least Reflect 7.3.5854 (This version will accept the upgraded version 8 key as valid)
- It must have a version 7 key
- The Agent must be in the connected state

# Macrium Site Manager User Guide

## Macrium Agent Licenses

Macrium Agent Licences (MALs) are installed on the Site Manager Server and each license provides a number of seats. These seats are automatically assigned to computers as they are connected to the Site Manager server. If a computer is removed from the Site Manager server, the seat is freed for use elsewhere. This makes using MALs quick and easy to use as they require no special client configuration. Multiple seats can be managed with a single key, making key and license management easier.

The drawback of these licenses are that they are dependent on communication with a Site Manager server - if the client computer cannot contact the Site Manager server, the agent cannot be used to perform backups as a standalone edition of Reflect could.

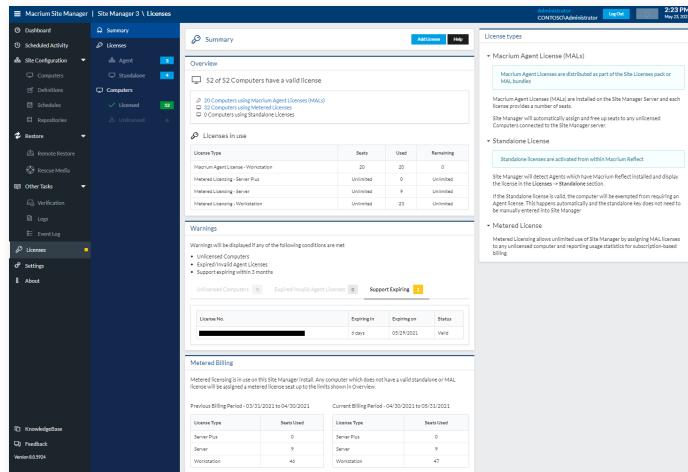

## Metered Agent Licenses

Metered licensing is available to MSPs and other Macrium partners. This provides unlimited use of Site Manager and provides regular billing on actual use counts. Site Manager reports usage counts to the Macrium license servers, which use the information to produce billing based on high watermark usage.

Metered keys are managed as a special Agent license key with a type of **Metered**. Only one metered key per Site Manager is permitted and when in use, additional statistics about metered license usage is displayed on the **Status** page.

## Managing Macrium Agent Licenses

The **Licenses** section of the Site Manager interface provides an overview of Macrium Agent License seats available and used in the **Summary** section.

License Type	Used	Remaining
Macrium Agent License - Workstation	20	0
Macrium Agent License - Server Plus	0	Unlimited
Macrium Agent License - Server	9	Unlimited
Macrium Agent License - Workstation	23	Unlimited

License No.	Expires In	Expires On	Status
[REDACTED]	8 days	05/29/2021	Valid

License Type	Seats Used	License Type	Seats Used
Server Plus	0	Server	0
Server	9	Server	9
Workstation	40	Workstation	47

This page also displays warnings if any agents are unlicensed or there is a shortfall in the appropriate license type. This may occur when there are insufficient workstation licenses for all workstation computers but excess server licenses. In this case, Site Manager will assign a server license to a workstation.

# Macrium Site Manager User Guide

The individual Macrium Agent License keys can be added, removed and viewed on the **Licenses Agent** tab:

The fields shown are.

Field	Description
Key	The license key
Licensed To	The user or company the key is licensed to
Key Type	The type of key. This may be <b>Server</b> , <b>Workstation</b> , <b>Server (VM)</b> or <b>Metered</b>
Validation Type	<b>Trial</b> , <b>Online</b> or <b>Offline</b> . If a key is added when there is no working internet connection, it can be added as an offline key if you have an appropriate validation key from Macrium. Online validated keys require regular checks with the Macrium license server, but are easier to add, remove and manage.
Key Version	The version of Site Manager the key is valid for. Currently only Version 8 keys are available.
Num. of Seats	The number of computers which may be licensed by this key.
Status	<b>Valid</b> or <b>Invalid</b> . This shows the status of the key as determined by the Macrium license server
Expiry	The date the key expires if the key is a trial.
Support Status	Whether this key has paid support and when the support expired/will expire

# Macrium Site Manager User Guide

Pressing the **Add License** button will allow you to add a license. Please note if you enter an older version 7 key, you will be prompted to upgrade the key to version 8, if the key is eligible for upgrade. Version 6 keys cannot be added at all, please contact Macrium Support for assistance in upgrading these keys.

In addition to multi-seat Macrium Agent License keys, standalone keys from Macrium Reflect (Workstation and Server editions) may be added as 1 seat Macrium Agent Licenses. These licenses are treated like any other Macrium Agent License and are not tied to specific computers.

This is intended to ease the transition to using Macrium Agent Licenses for customers who have a number of existing Reflect licenses. If you want to use the Reflect license as a standalone license on a specific computer connected to Site Manager, you do not need to enter the license here

## Offline Keys

If the Site Manager server is not connected to the internet, adding a MAL will display a code and link to the Macrium website which can be used to activate the key for offline use and provide a validation key which can be entered in the Site Manager interface to enable the offline key.

## Configuration and Security

- Security

  - Export Drivers
- Daily Data Export

This section is intended to discuss the security involved in Site Manager and show how these features and other features can be configured through the Site Manager interface.

---

## Security

The various forms of network communication in Site Manager have some built in security with options for further configuring them.

## Agent Communications

Communications between agent and Site Manager server are always encrypted using 256-bit AES encryption. This happens automatically, key generation, negotiation and encryption are all done without any additional configuration. In addition, a passphrase can be set in the Site Manager. This passphrase is set on any successfully connected agent and prevents any other Site Manager taking over that agent unless the new Site Manager has the same passphrase set.

The purpose of this passphrase is for use in high integrity or untrusted environments where a guarantee that only the Site Manager server that has been configured for that agent can access that agent is required.

If a passphrase has been set on an agent, it will fail to connect to a Site Manager which does not have the matching passphrase set. Reinstalling the agent will reset the passphrase.

The agent passphrase can be set in the **Agent Security** section of the **Security** settings below.

# Macrium Site Manager User Guide

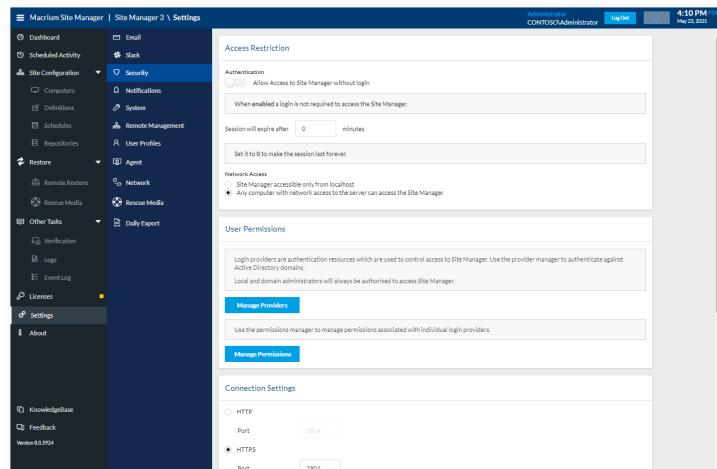

## Web Interface Access

The web interface used to access the Site Manager interface can use HTTP or HTTPS. By default the Site Manager uses HTTP access but is only accessible from the computer it is installed on. This restriction can be removed in the **Connection Settings** section of the **Settings** page.

If the interface is exposed to a potentially insecure network or the internet, we recommend using HTTPS. When HTTPS is first enabled, a default self-signed certificate is used. This certificate is not recommended for use outside secure networks as it is shipped with every Site Manager installation. Any certificate in OpenSSL .PEM file format can be used in place of the built in certificate. If you have keys in a different format, the OpenSSL command line utility can convert a variety of formats. See <https://www.openssl.org> for details.

## Configuration

To configure the settings for Site Manager, access the **Settings** page from the main menu:

This is divided into a number of sections which are explained in more detail below

## Email

The Email section is divided into three subsections - **SMTP Configuration** for setting up server details, **Notification Email** for configuring where notifications (Backup start, end and others) are sent to and **Backup Summary** for configuring daily status emails.

## SMTP Configuration

This section allows Email server settings to be configured, including security settings.

# Macrium Site Manager User Guide

SMTP Configuration

Sender's Email Address: Email Robot <macriumsm@contoso.com>

SMTP Server: smtp.contoso.com

Connection Type: Transport Layer Security (STARTTLS)

SMTP Port: 587

Authentication: Secure Username/Password login (AUTH LOGIN)

Username: mailuser@contoso.com

Password: \*\*\*\*\*

Test Email

Send a test email, to check your settings are working.

testing1@example.com; testing2@example.com

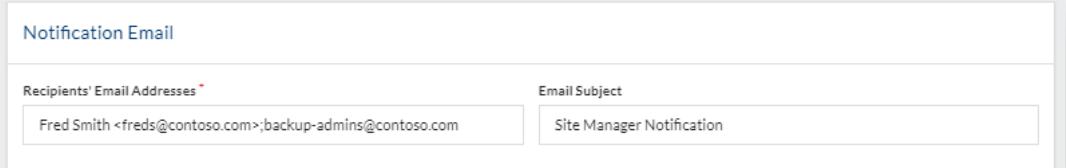

Send

Option	Description
<b>Sender's Email Address</b>	The email address the summary emails will be sent from.
<b>SMTP Server</b>	The address (DNS or IP) of the SMTP server to use for sending.
<b>Connection Type and Port</b>	The type of connection used by the SMTP server. Supported options are: <ul style="list-style-type: none"> <li>• Plain Text</li> <li>• Secure Sockets (SSL/TLS)</li> <li>• Transport Layer Security (STARTTLS)</li> </ul>
<b>Authentication</b>	The authentication method used by the SMTP server. Supported options are: <ul style="list-style-type: none"> <li>• None</li> <li>• Auto-Detect</li> <li>• Challenge/Response Authentication (CRAM-MD5)</li> <li>• Secure Username/Password login (AUTH LOGIN)</li> <li>• Username/Password login (AUTH PLAIN)</li> <li>• Microsoft NT LAN Manager (NTLM)</li> </ul>
<b>Username and Password</b>	The username and password for the SMTP server. If left blank, no username will be used.
<b>Test Email</b>	Sends a test message to the recipients entered in the test box. If there are errors in the send, they will be reported back.

# Macrium Site Manager User Guide

## Notification Email

This section allows the recipients and subject to be specified for notification emails. These setting are applied to any notification emails sent according to the **Settings Notifications** section.

Notification Email

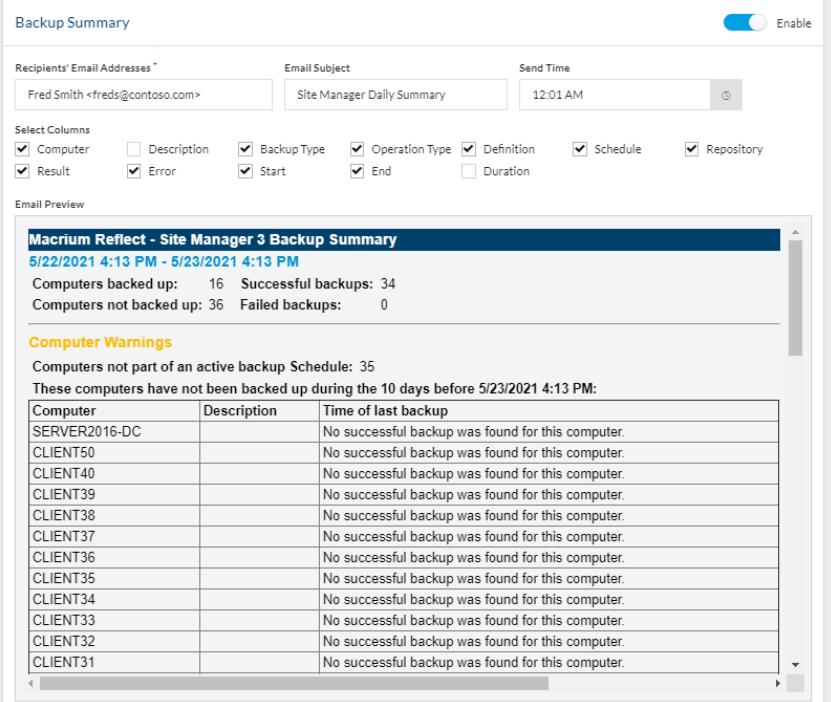

Recipients' Email Addresses:

Email Subject:

Option	Description
Recipients' Email Addresses	Email addresses to send notification emails - may be a semicolon separated list
Email Subject	Subject to be set on notification emails

## Backup Summary

The summary section allows configuration of daily backup summary emails as below:

Backup Summary

Enable:

Recipients' Email Addresses:

Email Subject:

Send Time:

Select Columns:

<input checked="" type="checkbox"/> Computer	<input type="checkbox"/> Description	<input checked="" type="checkbox"/> BackupType	<input checked="" type="checkbox"/> OperationType	<input checked="" type="checkbox"/> Definition	<input checked="" type="checkbox"/> Schedule	<input checked="" type="checkbox"/> Repository
<input checked="" type="checkbox"/> Result	<input checked="" type="checkbox"/> Error	<input checked="" type="checkbox"/> Start	<input checked="" type="checkbox"/> End	<input type="checkbox"/> Duration		

Email Preview

**Macrium Reflect - Site Manager 3 Backup Summary**  
5/22/2021 4:13 PM - 5/23/2021 4:13 PM

Computers backed up: 16 Successful backups: 34  
Computers not backed up: 36 Failed backups: 0

**Computer Warnings**  
Computers not part of an active backup Schedule: 35  
These computers have not been backed up during the 10 days before 5/23/2021 4:13 PM:

Computer	Description	Time of last backup
SERVER2016-DC		No successful backup was found for this computer.
CLIENT50		No successful backup was found for this computer.
CLIENT40		No successful backup was found for this computer.
CLIENT39		No successful backup was found for this computer.
CLIENT38		No successful backup was found for this computer.
CLIENT37		No successful backup was found for this computer.
CLIENT36		No successful backup was found for this computer.
CLIENT35		No successful backup was found for this computer.
CLIENT34		No successful backup was found for this computer.
CLIENT33		No successful backup was found for this computer.
CLIENT32		No successful backup was found for this computer.
CLIENT31		No successful backup was found for this computer.

The options available are:

# Macrium Site Manager User Guide

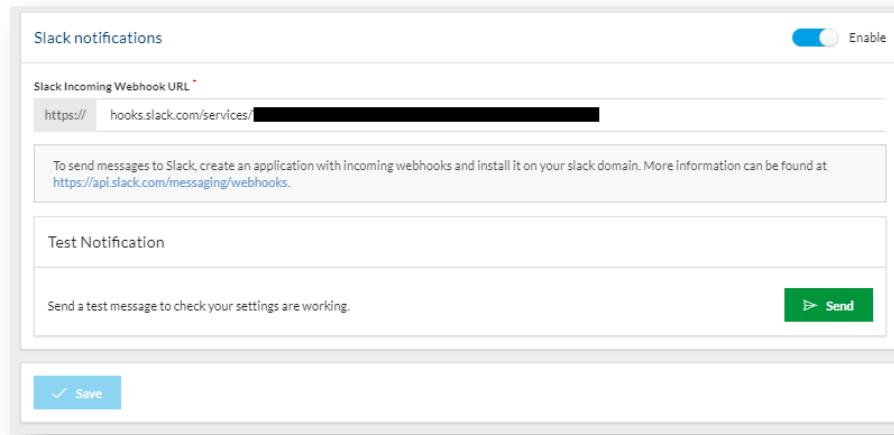

Option	Description
<b>Enable</b>	This toggle can be used to turn summary emails on or off
<b>Recipients' Email Addresses</b>	Email addresses to send notification emails - may be a semicolon separated list
<b>Email Subject</b>	Subject of the email
<b>Send Time</b>	The time when the daily email will be sent
<b>Select Columns</b>	Which columns should appear in the summary email. Changes to this section are reflected in the email preview underneath

A preview of the daily email with the selected columns is shown below the settings.

---

## Slack

The Management Console supports sending notifications to Slack. Once configured, the types of notifications can be configured in the Notifications section, below.

Slack notifications

Slack Incoming Webhook URL

To send messages to Slack, create an application with incoming webhooks and install it on your slack domain. More information can be found at <https://api.slack.com/messaging/webhooks>.

Test Notification

Send a test message to check your settings are working.

Option	Description
<b>Enable</b>	Toggle this to enable/disable Slack notifications.
<b>Slack Incoming Webhook URL</b>	Webhook to use to post Slack messages. This can be configured in Slack management by creating a private app. See <a href="#">Slack Webhooks</a> for more information

# Macrium Site Manager User Guide

Option	Description
<b>Channel</b>	Here you can specify which channel you wish to post to in Slack. You may wish to create a new channel in Slack for your notifications.
<b>Test Notification</b>	This button sends a test message to the slack channel configured above.

## Security

Here you can customize the various security options for the Management Console.

**Access Restriction**

Authentication

Allow Access to Site Manager without login

When enabled a login is not required to access the Site Manager.

Session will expire after  minutes.

Set it to 0 to make the session last forever.

Network Access

Site Manager accessible only from localhost

Any computer with network access to the server can access the Site Manager

**User Permissions**

Login providers are authentication resources which are used to control access to Site Manager. Use the provider manager to authenticate against Active Directory domains.

Local and domain administrators will always be authorised to access Site Manager.

**Manage Providers**

Use the permissions manager to manage permissions associated with individual login providers.

**Manage Permissions**

**Connection Settings**

HTTP

Port

HTTPS

Port

Certificate Path

Private Key Path

Private Key Passphrase

**Agent Security**

By default, all communications between Agent and Site Manager Server are encrypted. For higher security or operation in untrusted environments, advanced security can be enabled. This mode requires the same passphrase to be set on both the Agent and Site Manager server.

Standard Security: encrypt all communication between Agent and Server

Advanced Security: encrypt all communication between Agent and Server, require additional security on connection through a shared Passphrase

Custom Passphrase

**Save**

## Access Restriction

This section controls general access settings to Site Manager - which network interfaces the Site Manager UI is available on and whether user login is required. Finer control is provided under the **User Permissions** section.

# Macrium Site Manager User Guide

Option	Description
<b>Allow Access to Site Manager without login</b>	If enabled, any new connections to Site Manager will allow direct access without a login. This may allow unauthenticated users access to configuration and contents of backups and should only be used in a secure environment.
<b>Session will expire after X minutes</b>	Session expiry time can be set so that if the Site Manager interface is left open in a web browser, it will automatically log out after a specified number of minutes being idle.
<b>Network Access</b>	Setting this to <b>Site Manager accessible only from localhost</b> will make the Site Manager interface only accessible from a web browser running on the server itself. Otherwise the interface is available from any IP address.

## User Permissions

Dialogs to manage login providers and Site Manager access permissions can be accessed here. The provider manager is used to create, configure and delete login providers and the permissions manager is used to set permissions for each provider. For more information see: [Access Control](#).

## Connection Settings

This section allows you to configure HTTP/HTTPS connection settings for the Management Console. The defaults should be fine for most installations but you may wish to provide your own SSL credentials and possibly alter the ports if they conflict with other applications on your server.

By default, Site Manager supplies a self-signed certificate for HTTPS operation. As this key is shared between all Site Manager installations, it should not be considered secure if the Site Manager server is exposed to the internet or in any sensitive deployment. In these cases, we recommend an alternate key is used.

The keys supplied must be in OpenSSL .PEM format.

Different certificate management systems and providers use different names and file extensions to identify certificate files. The Site Manager server requires files using PEM format, under any file extension. These files can be identified by opening them in a text editor:

- Valid certificate files will contain a Base64 encoded certificate in a section denoted by -----  
BEGIN CERTIFICATE-----
- Valid private key files will contain a Base64 encoded key in a section denoted by -----BEGIN  
PRIVATE KEY-----
- If both the certificate and key are in the same file, the same file should be specified for both fields in Site Manager configuration

# Macrium Site Manager User Guide

Option	Description
<b>Port</b>	The port used by the Site Manager HTTP and HTTPS servers
<b>Certificate path</b>	The public certificate to be used by the internal Site Manager HTTPS server
<b>Private key path</b>	The private key which matches the certificate specified in the <b>Certificate path</b>
<b>Private key passphrase</b>	If the private key file requires a passphrase to use, it can be set here

## Agent Security

This section contains additional security settings for Agent communications. It allows an additional passphrase to be set - using a passphrase means that once communication has been established with an agent on a remote computer, the remote computer will only communicate with Site Manager servers which have the same passphrase set. This is intended to prevent any rogue processes emulating a Site Manager server and gaining access to the agent on a remote computer.

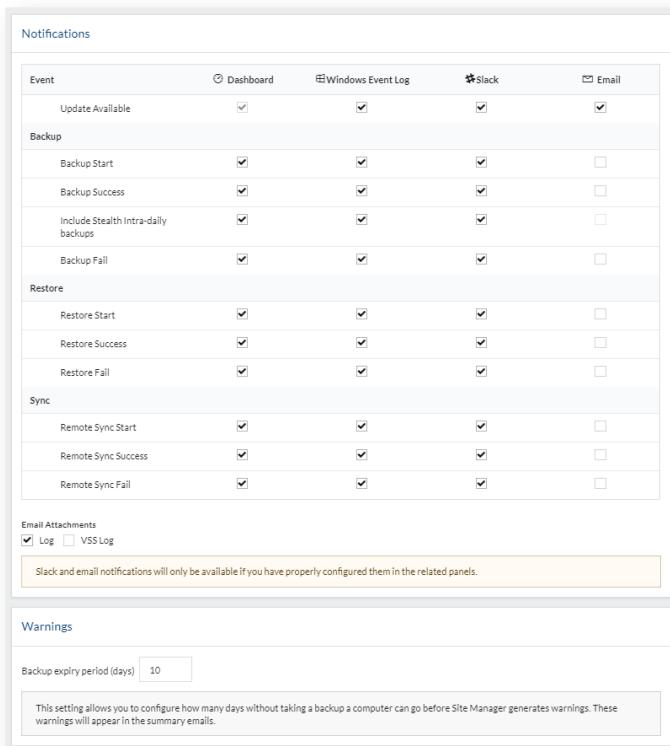

If a computer is added after previously having a passphrase set, the computer will be listed as **Unauthorized** in the computers list. To manage the computer, either the Site Manager server must have the correct passphrase, the passphrase on the agent must be changed (Requires local administrator access to the computer) or a passphrase can be entered on the Site Manager server to allow one-off access.

---

## Notifications

Here you can select which notifications appear in the User Interface, the Windows Event Log, over Slack or email (if configured).

# Macrium Site Manager User Guide

Event	Dashboard	Windows Event Log	Slack	Email
Update Available	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
<b>Backup</b>				
Backup Start	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Backup Success	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Include Stealth Intra-daily backups	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Backup Fail	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Remote Sync Fail	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Email Attachments  
 Log  VSS Log

Slack and email notifications will only be available if you have properly configured them in the related panels.

Warnings	
Backup expiry period (days)	10
This setting allows you to configure how many days without taking a backup a computer can go before Site Manager generates warnings. These warnings will appear in the summary emails.	

The options available are:

- **Update available** - sent when a software update to the Management Console is available.
- **Backup Start** - sent when a backup has started to run on a managed computer
- **Backup Success** - sent when a backup has completed successfully on a managed computer
- **Include Stealth Intra-daily backups** - this controls whether backup success emails should include intra-daily backups with the stealth option set. These backups do not create normal log files unless an error is encountered.
- **Backup Fail** - sent when a backup has completed unsuccessfully on a managed computer
- **Restore Start** - sent when a restore has started to run on a managed computer
- **Restore Success** - sent when a restore has completed successfully on a managed computer
- **Restore Fail** - sent when a restore has completed unsuccessfully on a managed computer
- **Remote Sync Start** - sent when a repository starts remote synchronization with another server
- **Remote Sync Success** - sent when remote synchronization with another server succeeds
- **Remote Sync Fail** - sent when remote synchronization with another server fails

Additionally, there are options to set whether relevant backup logs should be attached to emails and how many days without a backup should be allowed before the daily summary email warns that a computer is unprotected.

# Macrium Site Manager User Guide

## Warnings

The number of days a computer can go without backups before being flagged as having an error in the dashboard, computers page and daily status email is configurable here via the **Backup expiry period** setting.

## System

The system section contains options for modifying the behavior of the overall system. The options available are as follows:

### Server Name

The Site Manager will use the name set here in the user interface and emails.

Do not display a name  
 Display the server Computer name  
 Display a custom name

Custom Name

Configuration Transfer

Archive

Import settings

Download configuration

Log Retention

These options are to delete event logs and message state logs after a configurable amount of days.

Keep Logs  Keep logs forever  
 Number of days to keep logs  4-720 days

Support Information

Generate support information which can be shared with Macrium Support.

Option	Description
<b>Server Name</b>	<p>Allows a custom server name to be set. This server name will be shown in the title/tab bar of the browser, at the top of the Site Manager interface and in email subject lines.</p> <p>This allows organizations with multiple Site Manager installs to easily tell them apart. The naming options are:</p> <ul style="list-style-type: none"><li>• <b>Do not display a name</b> - this is the default setting</li><li>• <b>Display the server Computer name</b> - uses the NetBIOS name of the server</li></ul>

# Macrium Site Manager User Guide

Option	Description
	<ul style="list-style-type: none"><li>• <b>Display a custom name</b> - the name entered in the <b>Custom Name</b> field will be used</li></ul>

## Configuration Transfer

This section has options for backup up, downloading and restoring the Site Manager configuration:

Option	Description
<b>Archive</b>	Update the configuration archive on the Site Manager server with the current Site Manager configuration. Once complete, the timestamp shown by the <b>Download configuration</b> option will be updated
<b>Import settings</b>	Upload a previously create Site Manager configuration backup and apply the settings to this Site Manager server. The current Site Manager configuration will be overwritten
<b>Download configuration</b>	Download the latest created archive in the browser. This can be used to provide a backup of Site Manager settings in case of server hardware error

## Log Retention

This section allows logs (both backup logs and event logs) to be automatically deleted after a number of days. This will only happen if the **Keep Logs Forever** option is unselected. This option will affect both the backup logs and event logs.

## Support Information

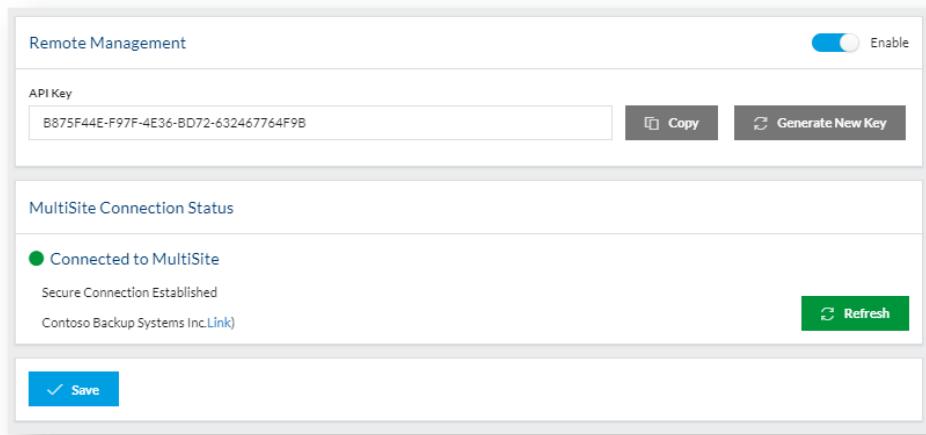

This section allows gathering of support information and upload to Macrium servers or download as a zip file. It should only be used under the direction of Macrium Support.

---

## Remote Management

The Remote Management section controls integration with Macrium MultiSite. If remote access is enabled and the HTTPS port configured in the **Security** section is exposed to the internet, the Site Manager can be managed by Macrium MultiSite.

# Macrium Site Manager User Guide

The options in the **Remote Management** section are as follows:

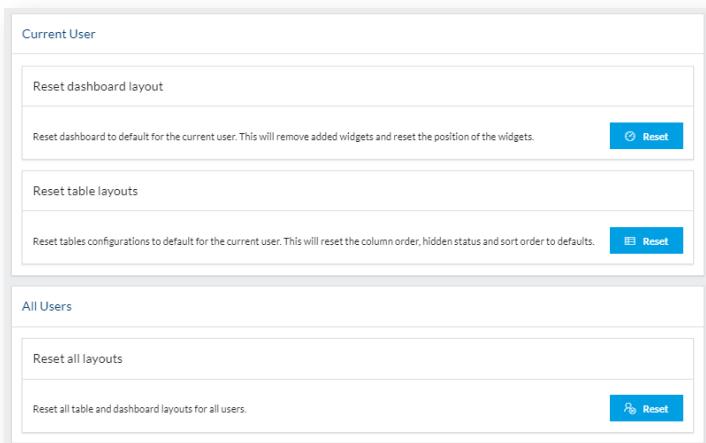

Option	Description
<b>Enable</b>	Enables the remote management interface for Macrium MultiSite on the same port used for HTTPS access. This does not affect HTTPS access.
<b>API Key</b>	This key is required to authorize MultiSite to access the Site Manager.
<b>Copy</b>	Copies the API key to the clipboard to make transferring it easier.
<b>Generate New Key</b>	Generates a new API key, replacing the old key. Note that if this Site Manager is managed by Macrium MultiSite, the key must be updated in MultiSite for continued access.

The **MultiSite Connection Status** section will only appear if Remote Management is enabled. This section will show the current status of the Site Manager's connection to MultiSite. The **Refresh** button retries the MultiSite connection if there are issues.

## User Profiles

This section controls the per-user configuration of the Site Manager Dashboard and interface

# Macrium Site Manager User Guide

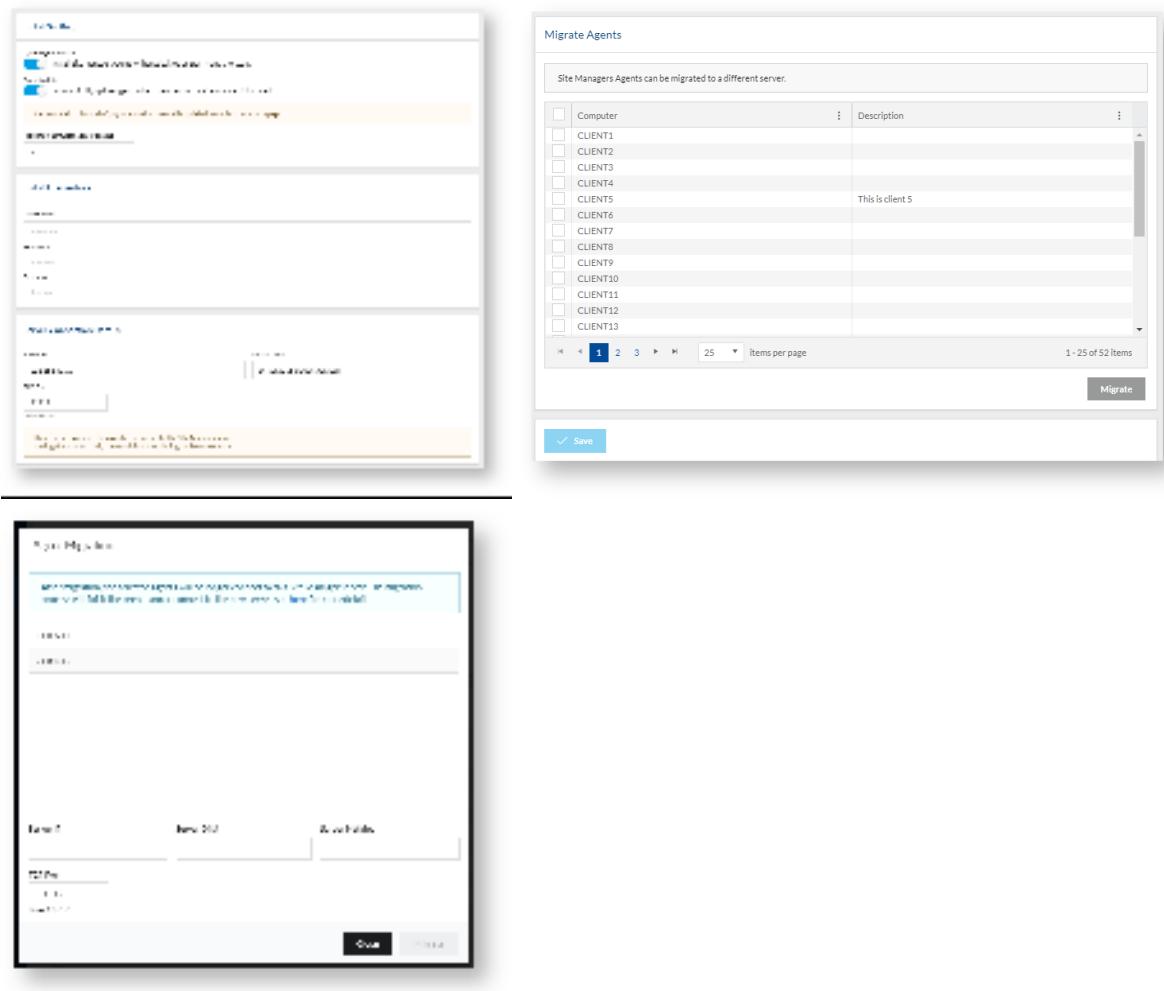

Option	Description
<b>Reset dashboard layout</b>	This option will restore the dashboard to the default layout, removing all widget layout and notification tile customization. This only applies to the currently logged in user
<b>Reset table layouts</b>	This option will remove any changes to the table layouts on all Site Manager pages. This includes moving, hiding or sorting columns. This only applies to the currently logged in user
<b>Reset all layouts</b>	Removes all customization for all users and resets Site Manager to default layout settings

## Agent

This section controls how Site Manager agents and remote agent installation work

# Macrium Site Manager User Guide

Option	Description
<b>Install Settings - Quiet Agent Install</b>	Setting this option will change the default install options for the remote agent install to install the agent without creating desktop or start menu shortcuts. Quiet install settings will only be updated on an agent when the remote install feature is used or the agent is upgraded through Site Manager
<b>Install Settings - Auto Update</b>	If this option is set, the server will automatically update the agents when a new version is available
<b>Maximum Simultaneous Updates</b>	This option specifies the number of updates that will be performed simultaneously
<b>Install Credentials</b>	

# Macrium Site Manager User Guide

Option	Description
	This option allows you to set credentials which will be used to install remote agents. This is useful if the majority of computers you wish to install agents on are on a domain which is not the same one used to log in to the Site Manager server
<b>Server Connection Details</b>	To change these fields while agents are connected will cause the server to send the new details to the <b>connected</b> agents. When an agent receives the new details, it will drop the connection and try to reconnect to the server. If the agent is not able to reconnect or if it wasn't connected when the details were changed the details must be manually set on the agent via Agent Config tool or remote install
<b>Server Connection Details - Server IP</b>	Additional IP addresses the Agent should use to communicate with the Site Manager. Any IP addresses here will be tried before DNS name resolution or NetBIOS name resolution is attempted.
<b>Server Connection Details - Server DNS</b>	Additional DNS names the Agent should use to look up the Site Manager server IP address. Any DNS addresses here will be tried before NetBIOS name resolution is attempted.
<b>Server Connection Details - TCP Port</b>	The TCP/IP port used by Site Manager to communicate with Agents. If this is changed, the Site Manager server will update all connected Agents and restart.
<b>Migrate Agents</b>	This section allows Agents to be moved from one Site Manager server to another - the selected Agents will attempt to connect to the server using the NetBIOS, DNS or IP addresses specified and if successful, the Agent will connect to the new server and drop into the disconnected status on the current server. If the Agent cannot contact a Site Manager server using the entered network details, they will remain connected to the current Site Manager server.

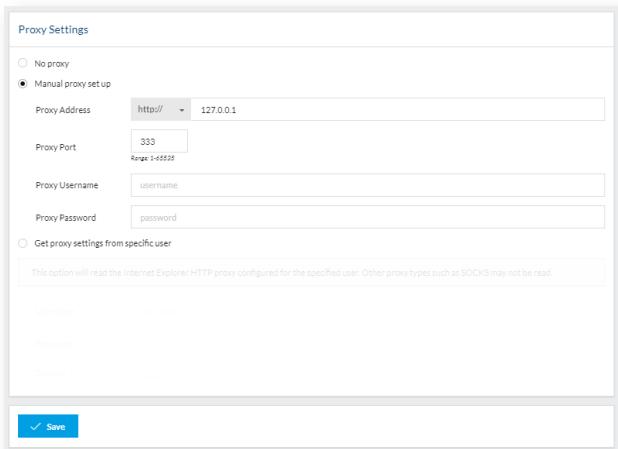

## Agent Server Connection

When installed via the Remote Install feature, Agents will automatically be configured with the NetBIOS name of the Site Manager server, plus any details configured here. The Agent will try all connection details to connect to a Site Manager server.

## Network

This section contains options controlling how the Site Manager server access the internet.

# Macrium Site Manager User Guide

Proxy Settings

No proxy

Manual proxy set up

Proxy Address: http:// 127.0.0.1

Proxy Port: 333  
Range 1-65535

Proxy Username: username

Proxy Password: password

Get proxy settings from specific user  
This option will read the Internet Explorer HTTP proxy configured for the specified user. Other proxy types such as SOCKS may not be read.

**Save**

## Proxy Settings

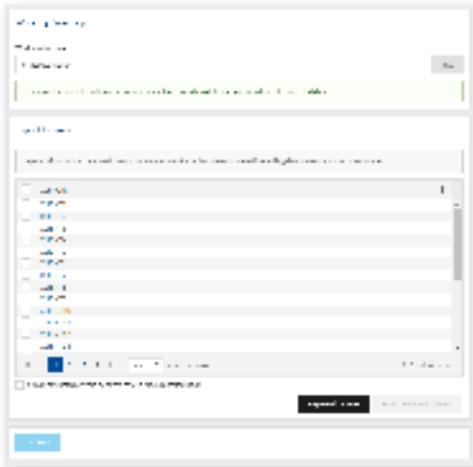

A proxy server may be configured here. Site Manager will use this for all HTTP/HTTPS requests to the internet.

Option	Description
No Proxy	Site Manager will access the internet directly
Manual Proxy Setup - Proxy Address	This is the address and type of the proxy server to use. The proxy type is selected from a dropdown (HTTP, HTTPS and SOCKS options)
Manual Proxy Setup - Proxy Port	Port of the proxy server
Manual Proxy Setup - Proxy Username	Username used to authenticate with the proxy server
Manual Proxy Setup - Proxy Password	Password used to authenticate with the proxy server
Get Proxy Settings From Specific User	If account details for an account on the local domain or computer are entered here, the Site Manager server will attempt to read Internet Explorer proxy information from this user's profile on the Site Manager server.

# Macrium Site Manager User Guide

## Rescue Media

This section contains options controlling how Site Manager builds rescue media.

## Working Directory

The Working Directory is the folder on the Site Manager server which is used as temporary space for Rescue Media building and to store the Rescue Media ISO images.

Option	Description
Working Directory	The path on the server to use for the Rescue Media working directory. This must be a local filesystem running NTFS. If this directory is changed, the old directory will be left intact and must be deleted manually.
Test	Tests that the Rescue Media working directory is accessible and writable.

## Export Drivers

Site Manager collects drivers needed to build Rescue Media from connected Agents. These drivers may be exported for use in disaster recovery by using the **Export all Drivers** or **Export Selected Drivers** options. This will copy all the drivers to the **drivers\export** folder in the Rescue Media working directory,

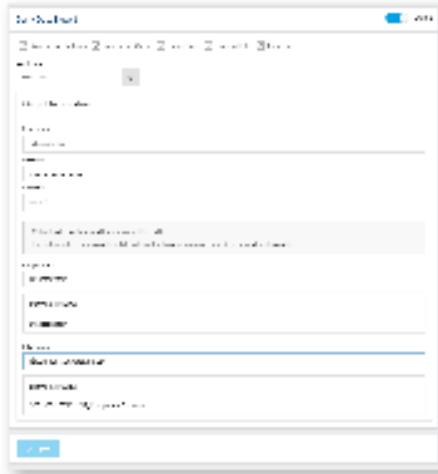

The **Group extracted drivers by Agent Rescue Media configuration** option places the exported drivers into subfolders based on the relevant Windows PE version for that computer - e.g. all computers which require Rescue Media based on Windows PE 10 64-bit will have their drivers exported to the **drivers\export\PE10x64** folder.

This can be useful when extracting drivers to create custom rescue media.

# Macrium Site Manager User Guide

## Daily Data Export

This section controls Site Manager's creation of a number of CSV files that can be exported on a daily basis to assist in auditing, third-party integration or custom scripting.

The initial options allow the types of export to be selected and the export time. The export types are:

Export Type	Description
<b>Repository Contents</b>	A list of backup images stored in each repository, along with type, path and size information
<b>Repository Usage</b>	This generates two files - one with an overview of each repository, including status, path, free space and space used by backups. The other file contains a breakdown of space used on each repository broken down by computer, including number of backups and disk space usage changes since last export.
<b>Computers</b>	A list of agent computers, along with status, last backup time and other information from the <b>Computers</b> page.
<b>Backup Data</b>	A list of backups attempted in the last 24-hours, including success or failure
<b>Event Log</b>	The last 24 hours of the event log

This section configures the file and folder information for the export. The credentials used to write the files can be controlled by specifying a username, password and domain for the account. If left blank, the SYSTEM account on the Site Manager server is used.

# Macrium Site Manager User Guide

The folder and file paths can be specified here using replaceable parameters - this allows a number of configurations, including creating each day's exports in the same place (overwriting old files), giving each day's export file a name based on the date, or placing each day's exports into a different subfolder.

Replaceable parameters are specified by placing them in curly braces with a dollar character - `{$example}`.

Available parameters are:

Parameter	Description
<code>{\$date}</code>	The date in <code>YYYYMMDD</code> format
<code>{\$time}</code>	The time in <code>hhmm</code> format
<code>{\$isotime}</code>	ISO 8601 timestamp of the export time - <code>YYYY-MM-DDThhmmss</code>
<code>{\$servername}</code>	Name of the Site Manager server as specified in <b>Settings System</b>
<code>{\$exporttype}</code>	Type of export. When exporting multiple export types, this should be used to prevent each export type overwriting the other. Possible values are: <ul style="list-style-type: none"><li>• Repository Contents</li><li>• Repository Status</li><li>• Repository Changes</li><li>• Computers</li><li>• Backup Data</li><li>• Event Log</li></ul>
<code>{\$increment}</code>	If a file already exists with the name generated, the export will overwrite the old file with the new one unless <b>increment</b> is used. Increment is a simple number that is incremented to create a unique file name for the export.  For example, if the filename field is set to <code>filename.csv</code> , each day, the old file will be overwritten. If the field is set to <code>filename-{\$increment}.csv</code> , the first day's export will create the file <code>export-1.csv</code> , the second day will create <code>export-2.csv</code> etc

## Access Control

- Introduction
- Login Providers
- Managing Login Providers
- Configuring Permissions

# Macrium Site Manager User Guide

## Introduction

Site Manager can be configured to allow different users on the Site Manager server or a Windows Active Directory Domain to login to Site Manager.

By default members of the Administrators group on the Site Manager server and members of Domain Administrators on the Site Manager server's domain can login. Additional domains and permissions can be configured as described below.

## Login Providers

Login providers serve as the interface between Site Manager and an authentication resource. There is a unique login provider for each authentication resource so that permissions for each resource can be managed independently by configuring the associated provider. Three types of Login Provider currently exist:

Login Provider Type	Authentication Resource	Included by Default	Notes
Server Local	User Account Control	Yes	Authenticates local users. Local administrator accounts will always have permission to access Site Manager.
Primary Server Domain	Active Directory	Yes (if the Site Manager server is joined to a domain)	Authenticates users on the domain the Site Manager server is joined to. It is created automatically and can not be removed by the user. Domain Administrators can log in using this provider.  <b>ⓘ Domain disconnections</b> If the server is moved from its domain then the provider will be converted to a Domain provider. A new Primary Server Domain provider will be created when Site Manager upon reconnecting to a domain.
Secondary Server Domain	Active Directory	Yes (if the Site Manager server is joined to a domain in a forest)	Authenticates users on domains within the forest the Site Manager server is joined to. It is created automatically and can not be removed.  <b>ⓘ Domain disconnections</b> If the server is moved from its domain then the provider will be converted to a Domain provider. A new set of Secondary Server Domain providers will be created on start up.

# Macrium Site Manager User Guide

Login Provider Type	Authentication Resource	Included by Default	Notes
Domain	Active Directory	No	This provider interfaces with Active Directory domains other than that which the Site Manager server is connected to.

## **ⓘ Active Directory compatibility**

Site Manager must connect with a Domain Controller which supports LDAP v3 for permissions to be set for accounts on the Domain. LDAP over SSL will be used if available.

## Managing Login Providers

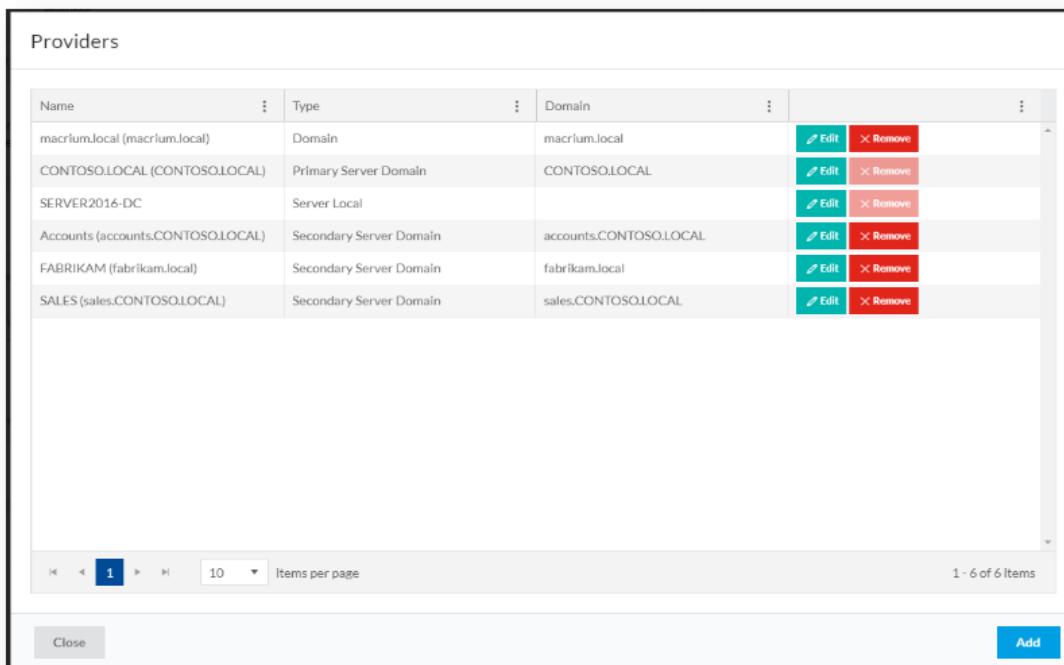

### **ⓘ Disabling Domain Forest Searching**

Site Manager automatically creates Local, Primary Server Domain and Secondary Server Domain providers on startup.

Users can stop Site Manager creating domain providers by setting the registry value "Configure default providers" in the key "HKEY\_LOCAL\_MACHINE\SOFTWARE\Macrium\Site Manager" to 0. This will prevent Site Manager from creating any providers except the primary domain and local computer providers.

While the automatic providers should cater for most needs, custom domain providers can be created to connect to domains outside of the forest the Site Manager server is in. Beware that members of authorized groups can only access Site Manager if they are on the same domain as the group. This differs from the automatic domain providers which support cross domain authorization.

# Macrium Site Manager User Guide

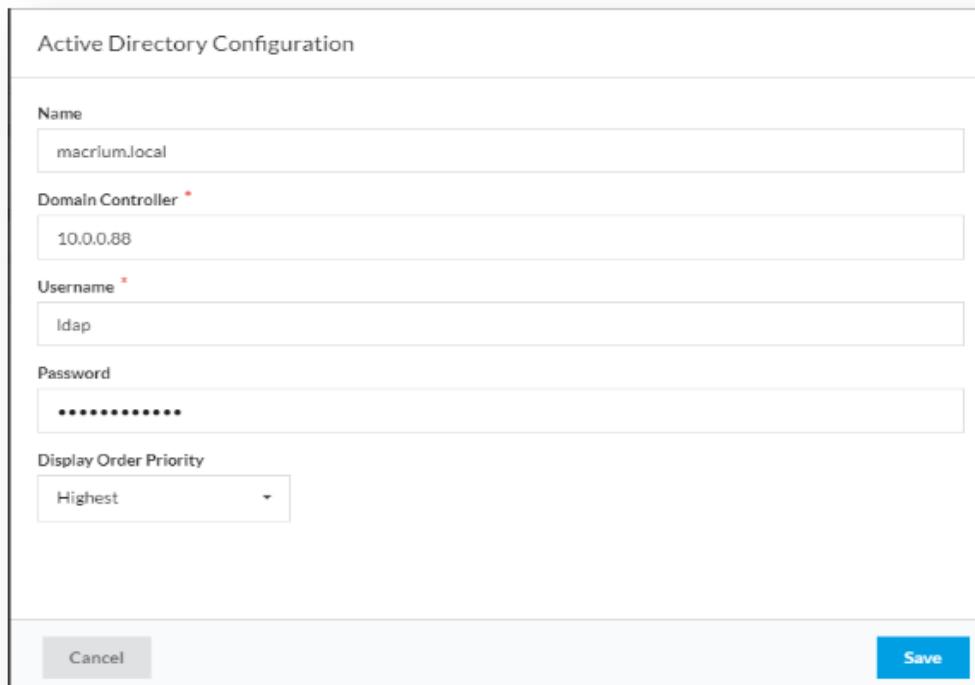

The screenshot shows the 'Providers' section of the Macrium Site Manager interface. It displays a table of providers with columns for Name, Type, Domain, and actions (Edit and Remove). The providers listed are:

Name	Type	Domain	
macrium.local (macrium.local)	Domain	macrium.local	<span>Edit</span> <span>Remove</span>
CONTOSO.LOCAL (CONTOSO.LOCAL)	Primary Server Domain	CONTOSO.LOCAL	<span>Edit</span> <span>Remove</span>
SERVER2016-DC	Server Local		<span>Edit</span> <span>Remove</span>
Accounts (accounts.CONTOSO.LOCAL)	Secondary Server Domain	accounts.CONTOSO.LOCAL	<span>Edit</span> <span>Remove</span>
FABRIKAM (fabrikam.local)	Secondary Server Domain	fabrikam.local	<span>Edit</span> <span>Remove</span>
SALES (sales.CONTOSO.LOCAL)	Secondary Server Domain	sales.CONTOSO.LOCAL	<span>Edit</span> <span>Remove</span>

Below the table are navigation buttons (Back, Forward, Page 10), an 'Items per page' dropdown, and a status message '1 - 6 of 6 items'. At the bottom are 'Close' and 'Add' buttons.

All providers are listed within the provider manager dialog. Providers can be configured or removed by clicking the respective buttons in the table. New providers can be created by clicking the **Add** button, which opens the a dialog to configure a new Domain provider.

The screenshot shows the 'Active Directory Configuration' dialog. It contains the following fields:

- Name:** macrium.local
- Domain Controller:** 10.0.0.88
- Username:** ldap
- Password:** (redacted)
- Display Order Priority:** Highest

At the bottom are 'Cancel' and 'Save' buttons.

A Domain provider can be configured with the following fields:

# Macrium Site Manager User Guide

Field	Notes
Name	A friendly name which is displayed to users. If no name is provided then the provider will be named after the domain it is associated with.
Domain Controller	The host name of a domain controller. This can be in the form of a DNS-style name, a NetBIOS address or an IP address.  <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"><p><b> ⓘ Custom ports</b></p><p>Site Manager will communicate with the domain controller using LDAP. To use custom ports (other than the default of 389 or 636) specify the domain controller in the <b>hostname:port</b> format.</p></div>
Username	The username of an account on the domain. The credentials of this account will be used to perform any lookups against the LDAP server.
Password	The password of the account specified by the username entered in the previous field.
Display Order Priority	The order the provider will appear in dropdown lists like on the login page and the permissions modal. There is also an option to hide the provider from lists other than the table in the provider manager which may be useful if there are unused automatically generated providers.

After clicking "Save", Site Manager will check the validity of the configuration. If a provider can be created then the configuration is saved and a provider is added to the list of providers in the previous window. Otherwise, an error message will appear explaining the problem.

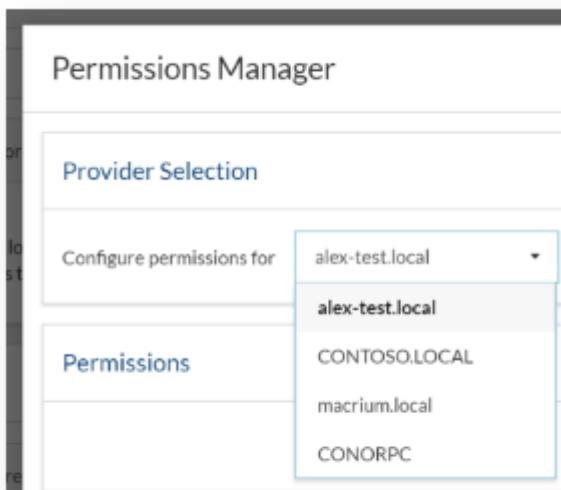

## Configuring Permissions

### ⓘ Default permissions

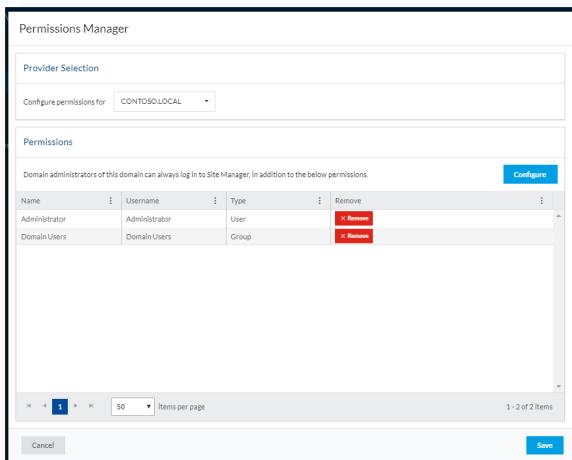

Admins of the domain the Site Manager server is connected to and local administrator accounts are granted Site Manager access by default. Permissions for domain admins can be disabled by setting the registry value "Disable Default Admin Access" in the key "HKEY\_LOCAL\_MACHINE\SOFTWARE\Macrium\Site Manager" to 1. Local administrators will always have permission to access Site Manager.

Next to the **Manage Provider** button on the security settings page is the **Manage Permissions** button. Clicking this button will open the permissions management window.

# Macrium Site Manager User Guide

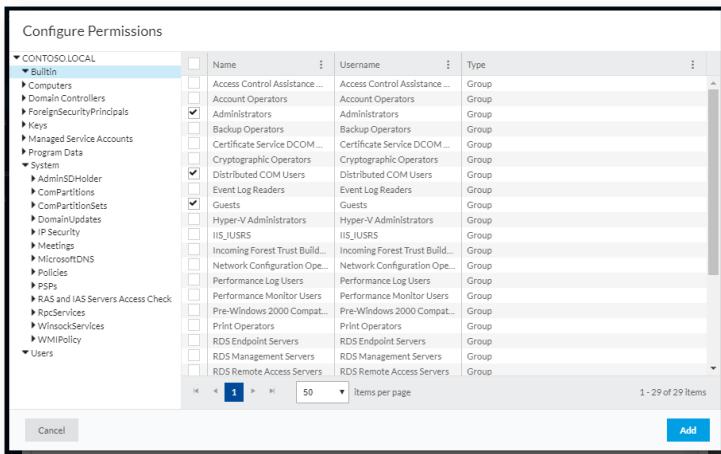

Permissions are configured separately for each provider. Select the correct provider from the dropdown before configuring permissions.

A table listing the active permissions is below the provider selection field. Here the names of authorized users and groups are displayed. All members of an authorized group are given the permissions of that group (membership is applied transitively). Permissions can be deleted by clicking the **Remove** button. Click **Configure** to add permissions. Changes to permissions can be discarded by clicking cancel.

# Macrium Site Manager User Guide

The structure of the directory is navigable through the tree on the left, which shows the folders and Organizational Units which have been configured on the domain. On the right is a table listing the users and groups in the selected folder. Rows can be selected to add corresponding permissions when the **Add** button is pressed.

## Macrium Image Guardian

- Introduction
- Installation
- Upgrades
- Configuration
  - Protecting Site Manager Repositories
- Advanced Usage Scenarios
  - Protecting a Repository hosted on a NAS or other external system

---

## Introduction

Site Manager 8 includes Macrium Image Guardian, which provides ransomware protection for backup files that are stored on the Site Manager server.

Macrium Image Guardian works by preventing unauthorized delete or write operations being performed on backup image files by any process that does not have a valid Macrium code signature.

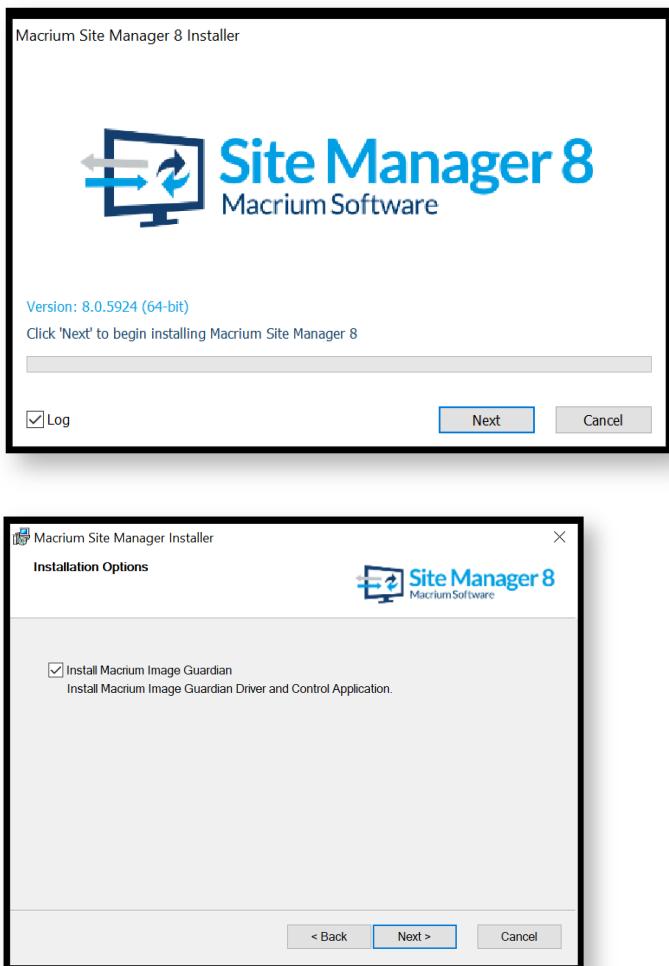

Image Guardian has been used by Macrium Reflect to provide malware protection since version 7.1.

Learn more about Macrium Image Guardian in Macrium Reflect [here](#)

## Installation

When you install Site Manager for the first time, the installation wizard will show you an option to install Image Guardian:

# Macrium Site Manager User Guide

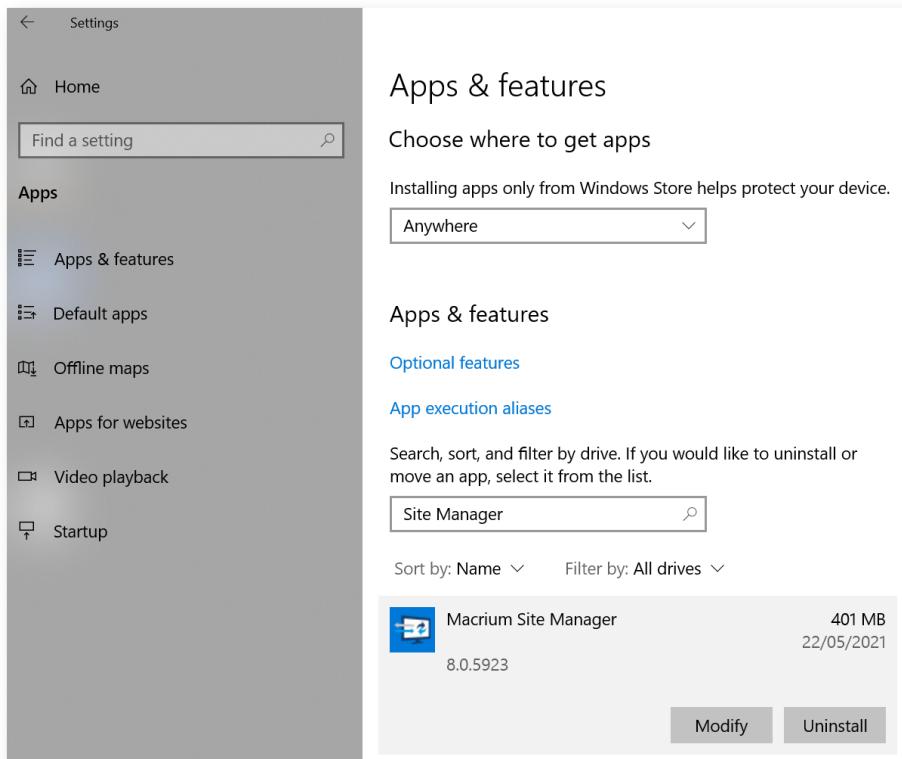

Once it has been installed, the computer may need to be rebooted before the Image Guardian driver is loaded and Image Guardian can provide protection.

## Upgrades

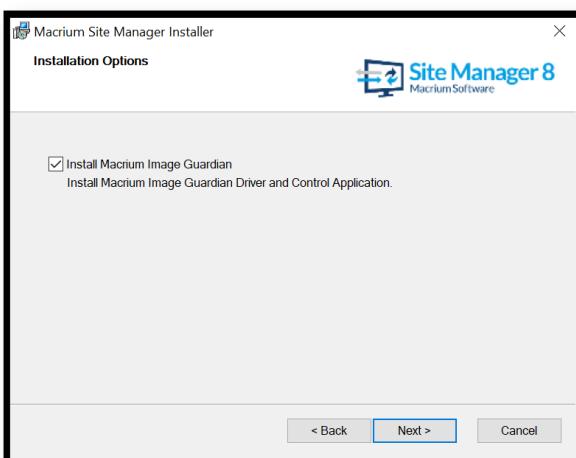

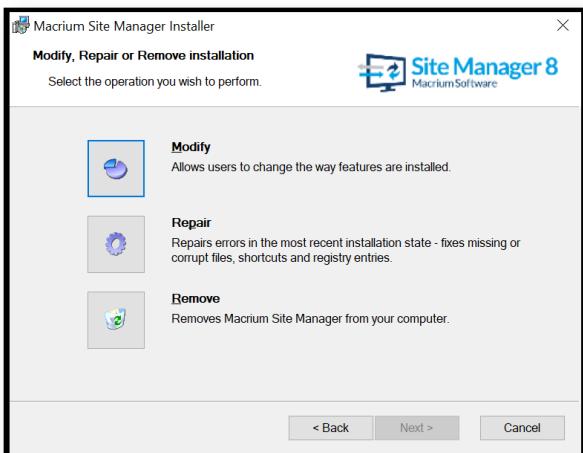

When upgrading in the Site Manager user interface, the Image Guardian status will be preserved. If it was *previously* installed, it will be installed and upgraded with the Site Manager server. If it wasn't, however, it *will not* be installed.

To change whether Image Guardian is installed after Site Manager installation, use the **Modify** option on the **Programs** (or **Apps and Features** in Windows 10) control panel

# Macrium Site Manager User Guide

# Macrium Site Manager User Guide

As with first time installation, you might need to reboot your computer before the Image Guardian driver is properly installed and usable.

## Upgrading the Image Guardian Driver

If Image Guardian is installed and an upgrade to the Image Guardian driver is installed, the Site Manager installer will set this update to happen on next reboot and the system will continue using the older driver until reboot. This is done to ensure that Image Guardian protection is not lost on upgrade.

If this happens, the Image Guardian configuration tool will warn that a reboot is pending and refuse to allow reconfiguration of Image Guardian settings until this has been performed

## Configuration

Once Image Guardian has been installed, you can configure it by running the Image Guardian configuration app. A desktop icon and start menu entry will be created by the Site Manager install.

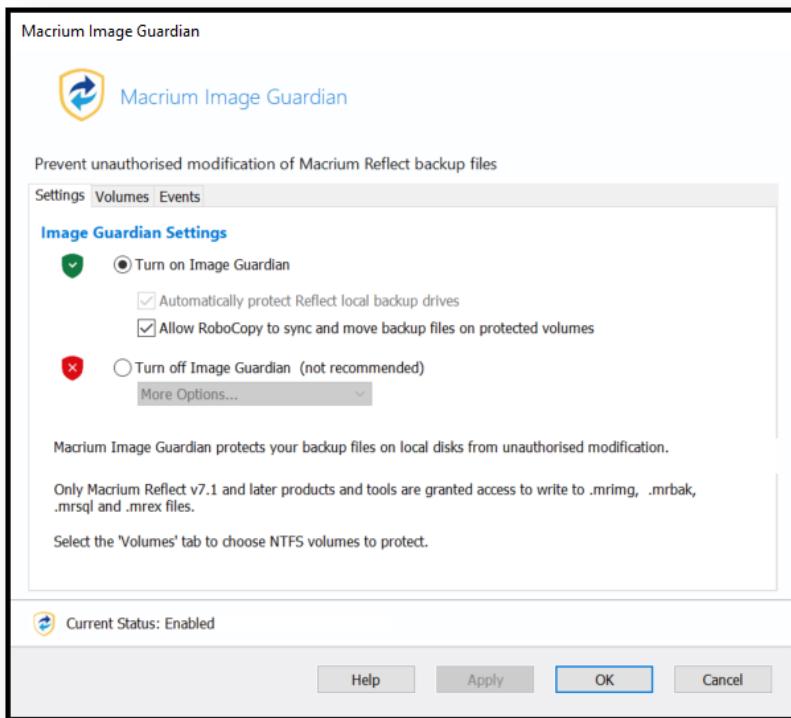

This is located in:

# Macrium Site Manager User Guide

C:\Program Files\Macrium\Common\MIGPopup.exe

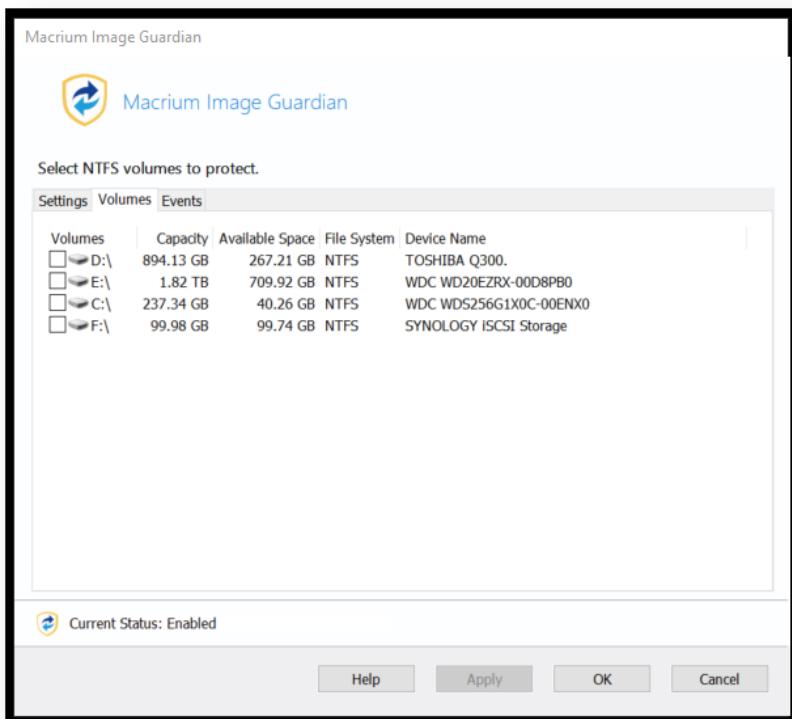

Running this program will display the following interface

This is where you can enable and disable Macrium Image Guardian. You can also disable it temporarily for fixed time periods to allow you to perform server maintenance.

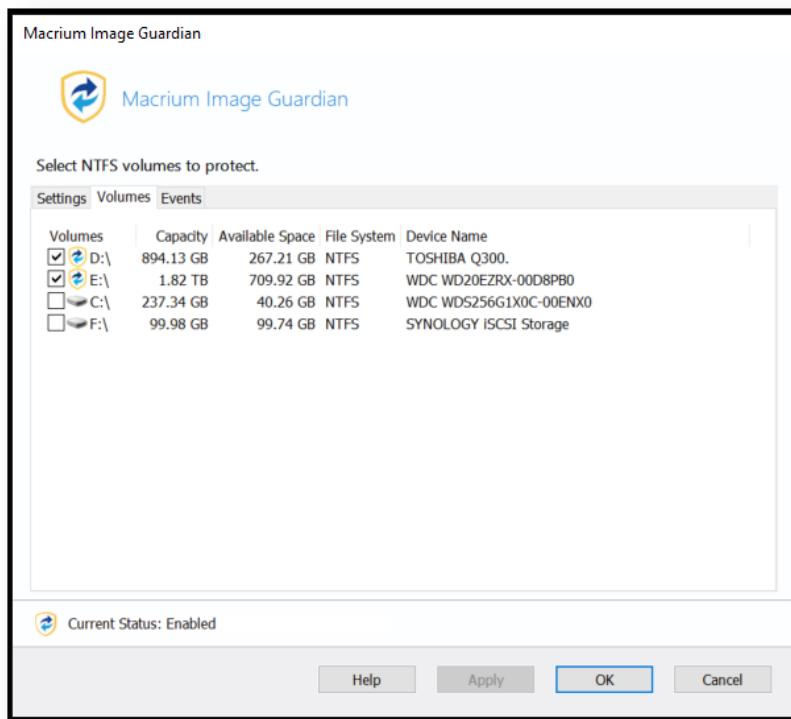

To enable Image Guardian on particular volumes, first Image Guardian must be turned on in the **Settings** tab, and then the volume selected in the **Volumes** tab

# Macrium Site Manager User Guide

This tab shows a list of all local disk partitions and their Image Guardian status. Once Image Guardian has been turned on globally in the **Settings** tab, the appropriate volumes selected in the **Volumes** tab, pressing **OK** or **Apply** will save the configuration. After this has been done, the **Volumes** tab will show protected volumes with an Image Guardian icon:

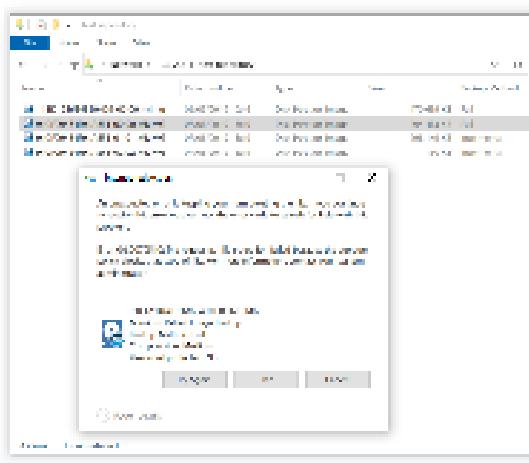

# Macrium Site Manager User Guide

## Protecting Site Manager Repositories

To protect a Site Manager repository, you should identify the volume with the repository share and enable Image Guardian on this volume. For example, if Site Manager has a repository on `\Isitemangerserver\repository` which corresponds to `c:\repos\repository`, the `C:\` volume should be protected. Once this is done only Macrium Reflect, Site Manager or the Site Manager Agent will be able to modify or delete image files. This means the files cannot be reached and encrypted by ransomware.

Any process which cannot be cryptographically authenticated as a Macrium process will be denied access to delete or write to backup image files:

# Macrium Site Manager User Guide

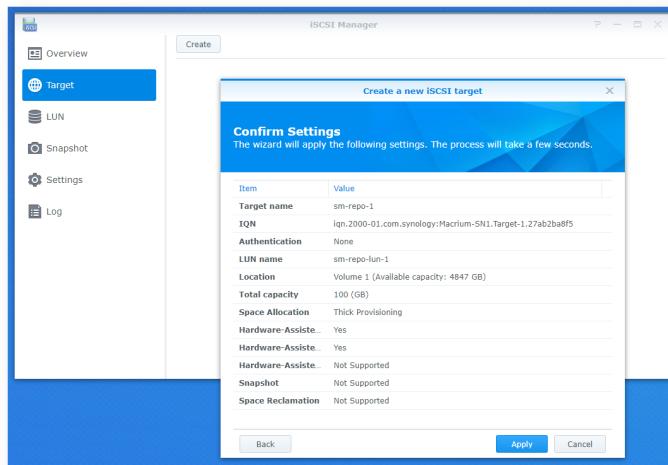

## Advanced Usage Scenarios

### Protecting a Repository hosted on a NAS or other external system

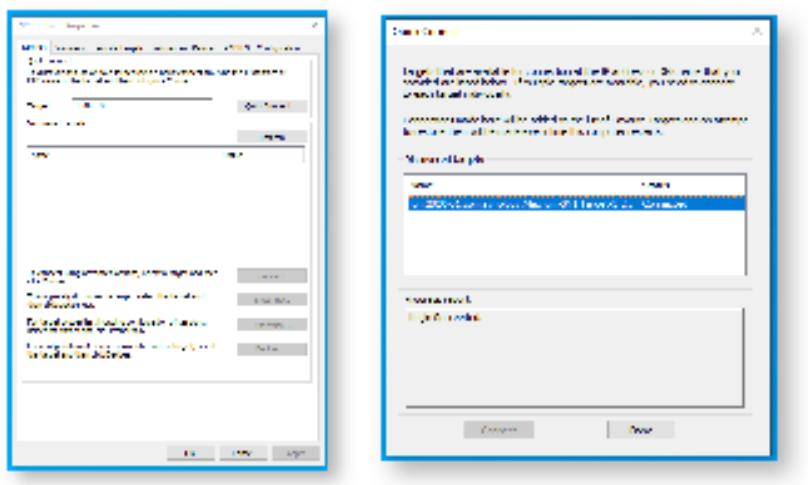

Macrium Image Guardian can be used to protect volumes on any locally attached disk or storage system, but often repository data resides in a NAS, which can't be directly protected by Site Manager.

To provide protection in these cases, the Site Manager server can be used as an intermediary between the NAS and Agents by attaching the NAS disk via **iSCSI**.

Many NAS devices and storage systems allow storage to be exposed via iSCSI, for example on a Synology NAS, iSCSI Manager can be used:

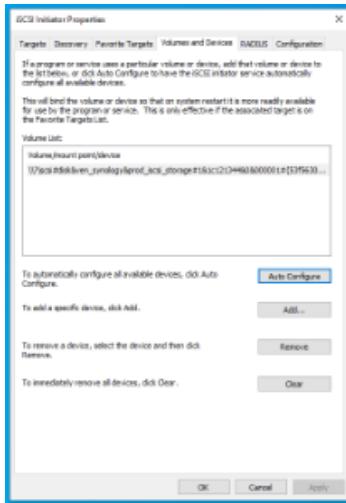

Once the iSCSI target has been created on the NAS, it can be connected to the Site Manager server by using the Windows iSCSI initiator:

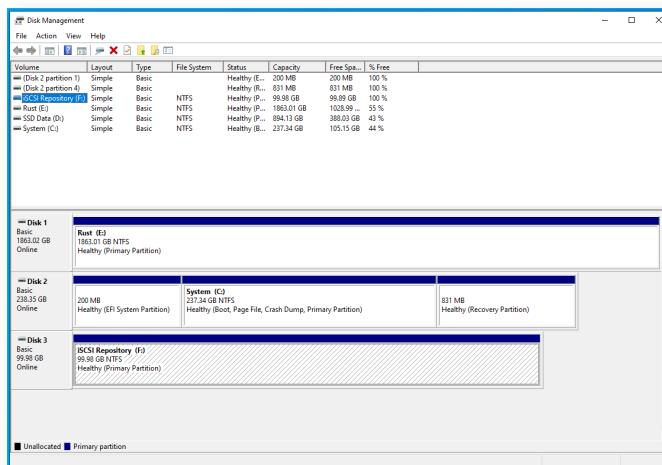

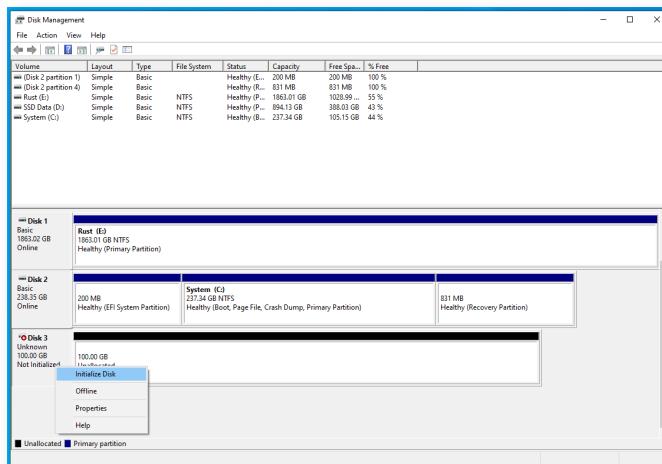

Once the initiator has connected to the iSCSI target, the target LUN can be mounted in the **Volumes and Devices** tab. In the simple case here, using the **Auto-Configure** option is suitable.

# Macrium Site Manager User Guide

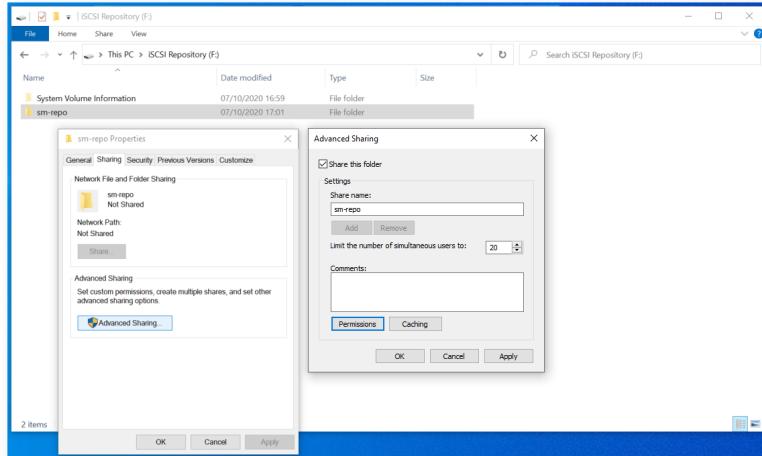

We recommend using CHAP or other authentication to the iSCSI backend to ensure that no malware, ransomware or other malicious software can gain access to the iSCSI target directly.

Once the target is connected, it will appear as any other disk in Windows and can be initialized, partitioned, formatted and have a drive letter (or mount point) assigned in the Windows Disk Management tool

# Macrium Site Manager User Guide

With this done, an appropriate folder can be created and shared on the iSCSI target. This share can then be used to create a Site Manager repository.

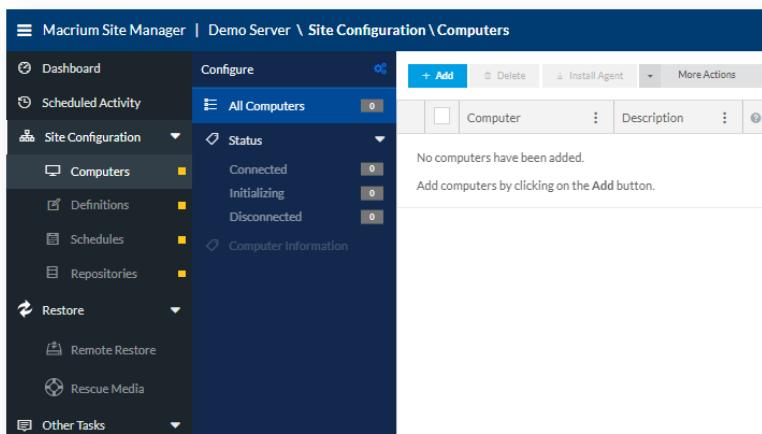

## Performance Notes

In this configuration, all backup traffic will be channeled through the Site Manager server instead of going direct from Site Manager Agent to NAS.

If the Site Manager server has poor network connectivity to either the Agent computer or the NAS, backups may be slower than a direct connection.

## Scheduling Centrally Managed Backups

Configuring the Site Manager to perform centrally scheduled backups can be done by following the **Site Configuration** section of the menu on the left hand side of the user interface as shown below:

The sections are:

# Macrium Site Manager User Guide

1. **Computers** - This section allows you to add client computers to the Site Manager, remotely install the Site Manager agent and monitor communication status between agents and Site Manager.
2. **Definitions** - This section is used to create Backup Definitions - a set of template based rules which allow you to quickly define backups for multiple computers simultaneously. A Backup Definition can also be run directly from this page, creating a single point in time backup
3. **Schedules** - This section is used to create Schedules - a set of rules which determine frequency of backups (daily, monthly etc.), which type of backup is created (full, differential, incremental) and what backup retention rules apply.
4. **Repositories** - Repositories are storage locations for backups

Once these sections have been configured, backups can be run by using the Scheduled Activity page.

# Macrium Site Manager User Guide

## Viewing and Managing Computers

Remote computers are viewed and managed from the **Computers** page of Site Manager, under the **Site Configuration** heading on the left hand side column. This page displays a list of all managed computers:

The screenshot shows the 'Computers' page in the Site Manager interface. The left sidebar has 'Computers' selected under 'Site Configuration'. The main area shows a table of computers with columns for Computer, Description, Status, Activity, and Tags. Each computer row has a 'More Actions' dropdown. The table includes rows for CLIENT1, CLIENT2, CLIENT3, CLIENT4, and CLIENTS. The 'Activity' column shows recent operations like 'Image Restore' and 'Image Backup'. The 'Tags' column shows various tags assigned to each computer, such as 'Last Backup Failed', 'No Recent Backups', 'Agent 8.0.5918', '32-bit', 'Workstation', 'Virtual Machine', and 'Windows 10'.

The dark blue side menu may be helpful to filter the computers by Groups and Tags.

## Toolbar Buttons

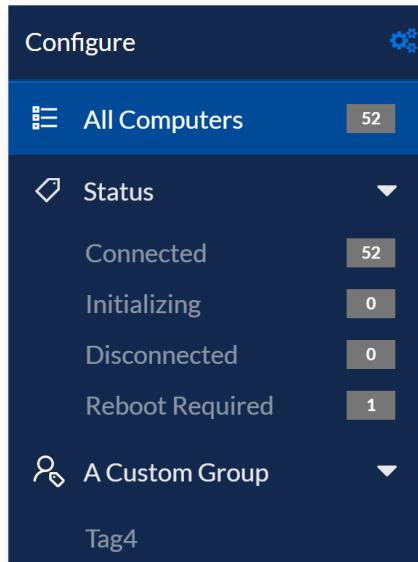

The screenshot shows the 'More Actions' dropdown for selected computers (CLIENT1, CLIENT2, CLIENT3). The dropdown includes options: Upgrade Agent, Force Reconnect, Set Passphrase, and Manual Agent Installation. The main table on the right shows the selected computers and their status (Connected). The 'Activity' column shows recent operations like 'Image Restore' and 'Image Backup'. The 'Tags' column shows various tags assigned to each computer, such as 'Last Backup Failed', 'No Recent Backups', 'Agent 8.0.5918', '32-bit', 'Workstation', 'Virtual Machine', and 'Windows 10'.

- **Add** - Adds new computers to Site Manager. See the section later on this page for details.
- **Delete** - Deletes selected computers from Site Manager.
- **Install Agent** - Uses remote MSI tools to install or reinstall the remote agent on computers.
- **Upgrade Agent** - If automatic upgrade of Agents is turned off in settings, this button can be used to initiate Agent upgrades.
- **Force Reconnect** - Disconnects and reconnects the computer and updates computer data from the selected computers.
- **Set Passphrase** - Allows the passphrase for the selected agent to be updated to the one used installing the Agent.
- **Manual Agent Installation** - Exports the computers table data as CSV. This can be imported into other tools.

# Macrium Site Manager User Guide

- **Open Filters** - Opens the filters of the table.
- **Download to CSV** - Downloads the content of the computers table to CSV.

## Groups and Tags Side Menu

- **Configure** - Configure Groups and Tags and their visibility. More information about Groups and Tags can be found [here](#).
- **All Computers** - Shows all the computers.
- **Status and A Custom Group**: Groups to filter the computers by.

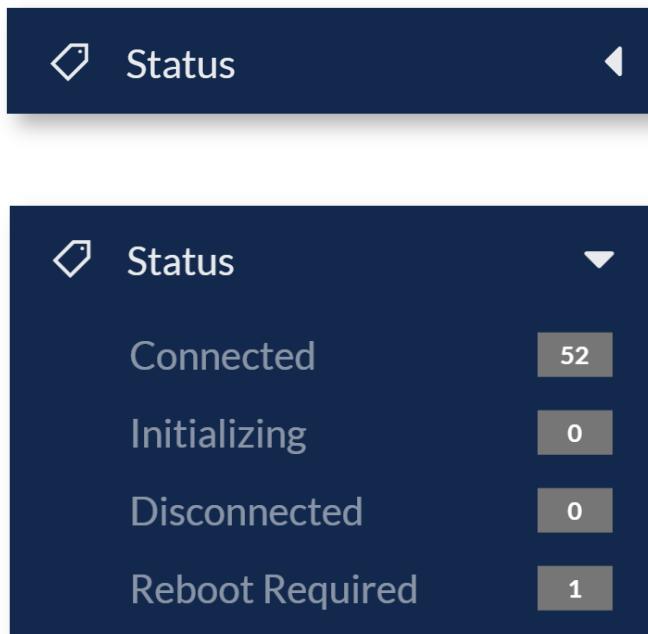

Clicking on a group or a tag filters the computers.

The image shows the main computer management interface. The sidebar on the left is the same as the previous screenshot, with 'Connected' selected. The main area is a table titled 'Connected 1 - 50 of 52 Computers'. The table has columns for Computer, Description, and Status. The data is as follows:

Computer	Description	Status
CLIENT1	Computer's Description	Connected
CLIENT2		Connected
CLIENT3		Connected
CLIENT4		Connected
CLIENT5	This is client 5	Connected
CLIENT6		Connected
CLIENT7		Connected (Reboot Required)
CLIENT8		Connected
CLIENT9		Connected
CLIENT10		Connected

# Macrium Site Manager User Guide

The group can be collapsed or expanded by clicking on the  icon

To know how to hide groups from the side menu and from the tags column, [click here](#).

## Computer Statuses

The following table contains all the possible statuses for a computer:

Agent State	Description	Additional Information
<b>Connected</b>	The computer is online and running a remote agent.	If the status is <b>Connected (Reboot Required)</b> , the computer is online, as in the <b>Connected</b> status, but there is a reboot pending due to an agent upgrade. The Agent will continue to function normally but will not use the CBT driver until it's rebooted.
<b>Connected (Reboot Required)</b>		<b>Connected (Upgrade Required)</b> Agents are running out of date Agent software. These Agents will either upgrade automatically or require the <b>Upgrade Agent</b> function to be used depending on the Site Manager settings.
<b>Initializing</b>	The Agent is negotiating their connection with the Site Manager Server.	Initializing Agents cannot be interacted with until they enter the <b>Connected</b> state.
<b>Installing Agent</b>		These Agents cannot be interacted with until the install or update operation is completed.

# Macrium Site Manager User Guide

Agent State	Description	Additional Information
<b>Upgrading Agent</b>	The Agent is in the process of installing or upgrading Agent software	
<b>Unlicensed</b>	The computer does not have an appropriate standalone or Macrium Agent License.	A new license can be added by going to the Licenses page.  Alternatively, if a copy of Macrium Reflect is installed on an <b>Unlicensed</b> computer and the computer status refreshed, it will change state to <b>Connected</b> .
<b>Unauthorized</b>	Mismatch between the passphrase on the Agent and Server	<b>Set Passphrase</b> in the toolbar allows the passphrase for the selected agents to be updated to the one used installing the Agent. If the passphrase set on the server and the agent match, the computer will re-initialize and enter the <b>Connected</b> state.
<b>Disconnected</b>	The Site Manager agent is not connecting to the server	Agents in this state may not have an Agent installed or may be experiencing communications issues. To resolve this, the Agent can be installed by the <b>Install Agent</b> function or manually on the Agent computer. If the agent is already installed on the computer, see the <a href="#">Troubleshooting Agent Communications</a> page for more details.

## Computer Details

Each managed computer row can be expanded to show detailed information on the computer. To open or close the computer detail information, click the ▶ marker on the left hand side of the computer row. The information is divided into tabs, as follows:

### Details

Shows the basic details of a computer as well as the last activity data.

# Macrium Site Manager User Guide

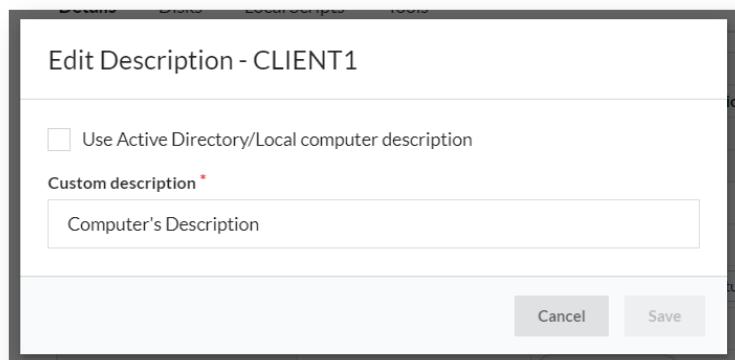

Details	Disks	Local Scripts	Tools	
Computer	CLIENT1	Custom Description	<a href="#">Edit</a>	Computer's Description
Windows Version	Windows 10 (32-bit)	Active Directory Description	-	
Domain	CONTOSO.LOCAL	Local Description	-	
Active Directory Group	Test Site 3 Things\Test Group	Reflect Edition	-	
	Agent Version	Agent 8.0.5924		
	Backup Definitions	Mix OS		
	Computer Information	32-bit Workstation Virtual Machine		
Tags	<a href="#">Edit</a>	Domain	CONTOSO.LOCAL	
		Domain OU	Test Site\Test Group	
		License Status	Agent Licensed	
		Operating System	Windows 10	
Current Activity	-			
Last Successful Backup	Image Backup (Incremental) at 05/24/2021 2:05:07 AM			
Last Failed Backup	Image Backup (Incremental) at 05/21/2021 1:00:02 AM <span style="color: red;">⚠</span>			
Last Operation	Successful Image Backup (Incremental) at 05/24/2021 2:05:07 AM			

*Description* and *Tags* can be edited by clicking on [Edit](#).

## Custom Description

Identify a computer by its description. It can be edited by clicking on [Edit](#).

It can show the Active Directory/Local computer description or a custom description can be provided.

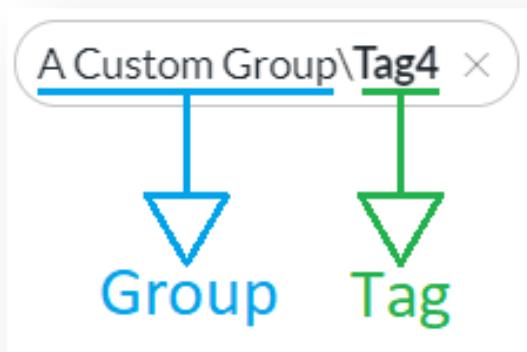

## Tags

Tags are useful to group some of the computers in meaningful ways. To know more about tags, [click here](#).

This is what a Group and Tag look like:

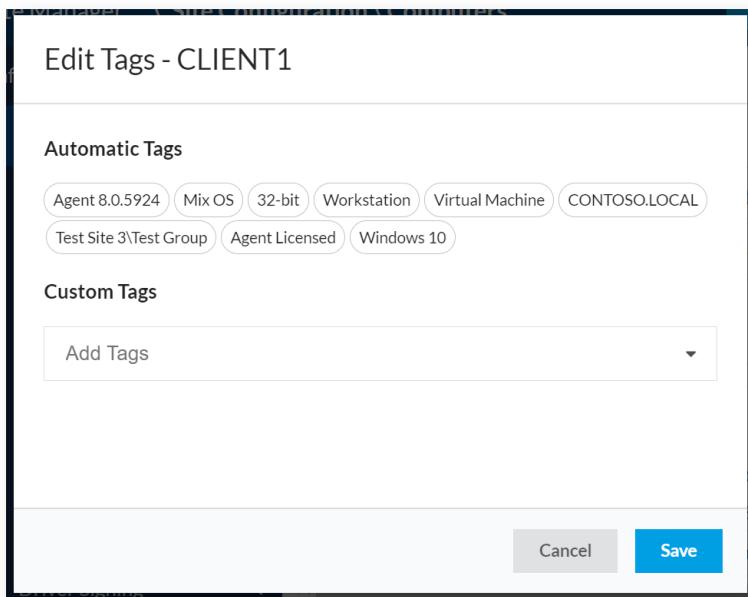

# Macrium Site Manager User Guide

The Group and the tag are separated by the \ character. Everything before the \ is the group and everything after is a tag.

If the separator character is not present it means it's only showing the tag name.

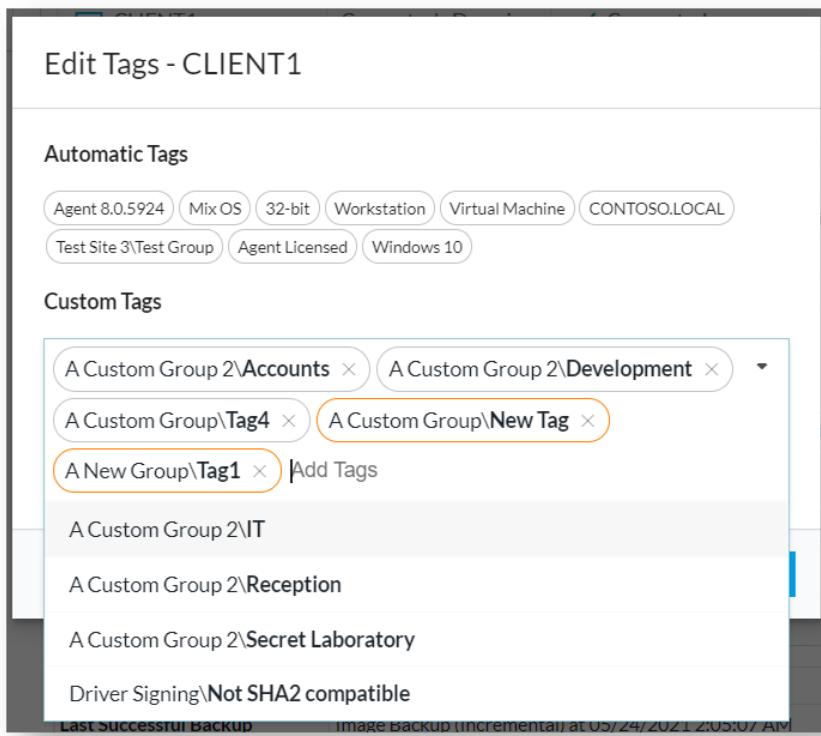

Automatic tags are calculated automatically and cannot be edited directly.

## Assigning a Tag

Tags can be assigned to a computer from this view.

# Macrium Site Manager User Guide

Existing tags can be assigned to a computer by selecting them on the dropdown menu.

Groups or tags can be searched for by start typing on the input.

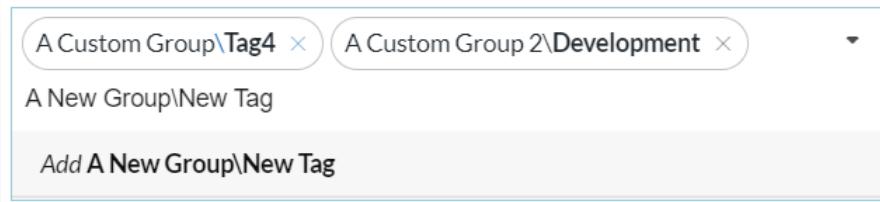

## ⓘ Shortcut

If you don't want to type the full group name when searching for a group or a tag, press **Tab** and it will automatically fill the rest of the group name for you.

The same is valid for the tag name.

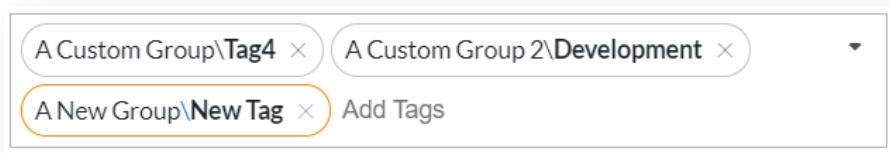

## Creating New Groups or Tags

New groups and tags can also be created and assigned to a computer in one go. That can be done by typing a new group or tag and press *Enter* or clicking on the *Add* option.

After adding the new group or tag, it will show as orange - meaning it is a new group or tag.

# Macrium Site Manager User Guide

In the example above, a new group called *A New Group* will be created and a new tag called *New Tag* will be added to that group.

## Disks

The disks and partitions on the computer are shown here, to help in determining how and what to backup from this computer.

Details	Disks	Local Scripts	Tools		
▼  MBR Disk 1 - Virtual HD 1.1.0 <40.00 GB>					
#	Volume	Type	FS	Used	Total
1	System Reserved (NONE)	Active	NTFS	353.7 MB	549.0 MB
2	(C)	Primary	NTFS	19.67 GB	39.46 GB

## Local Scripts

The legacy tab contains information from agents about standalone Macrium Reflect installations. This tab is included to help with the transition of backup scheduling from being locally scheduled on each computer to being centrally scheduled on the Site Manager.

A list of .xml backup definitions and script files stored locally on the computer are listed here and may be run manually from Site Manager with the '**Run Now**' option.

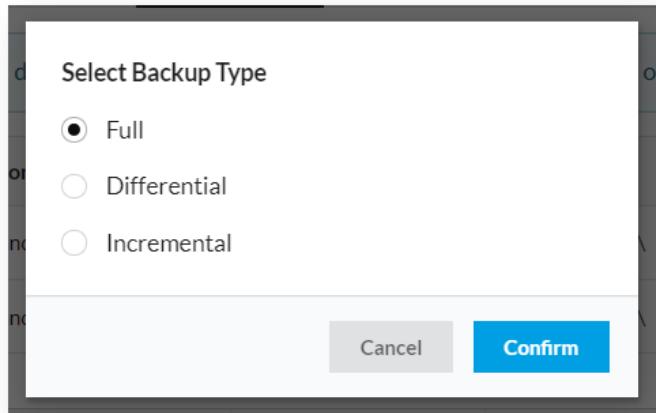

# Macrium Site Manager User Guide

Details Disks **Local Scripts** Tools

Local definition files are stored on the Agent computer rather than on the Site Manager computer.

Definition	Path	File Type	Backup Type	
Test Standalone Backup.vbs	C:\Users\administrator\Documents\Reflect\	VBS	Image	
Test Standalone Backup.xml	C:\Users\administrator\Documents\Reflect\	XML	Image	

After pressing 'Run Now' a dialog will pop up to select the type of backup (Usually Full, Differential or Incremental but may have other options for different backup types) and confirm the backup:

## Tools

Some extra features that are less used can be found in this view: *Resync Logs* and *Get Network Information*.

Details Disks Local Scripts **Tools**

Resync Logs: Force resync of logs of the agent. Logs will be updated if they have been modified.

Get Network Information: Query external Network Information for this Computer

### Resync Logs

A confirmation modal will be shown before starting the resync.

The selected Agents will be disconnected and on reconnect will resync all backup logs.

### Get Network Information

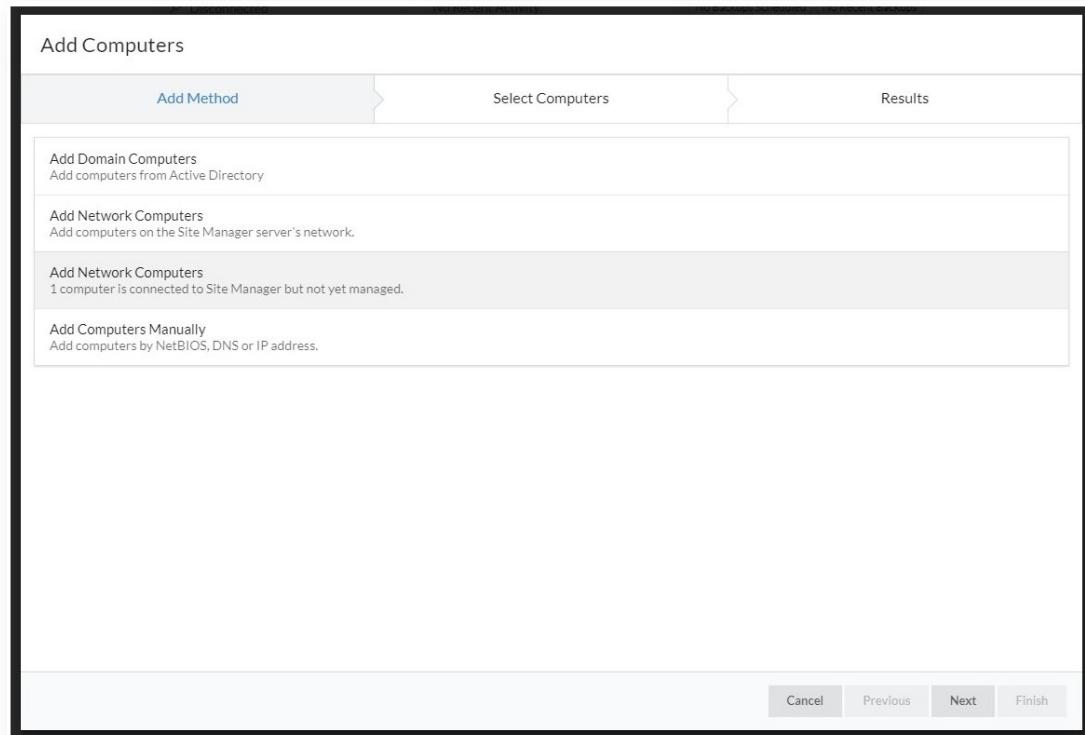

# Macrium Site Manager User Guide

Network Information - CLIENT1	
NetBIOS Name	CLIENT1
DNS Entry	192.168.42.56 CLIENT1.EXAMPLE.LOCAL
LLMNR (Broadcast) Lookup Result	192.168.42.56 Client1
NetBIOS over TCP Lookup Result	192.168.42.56 CLIENT1
Transport Type	TCP
Transport Layer Address	[::ffff:192.168.42.56]:53744
Transport Layer Status	No errors reported
Transport Layer Message Queue Size	0 queued messages

Close

## Adding New Computers to Site Manager

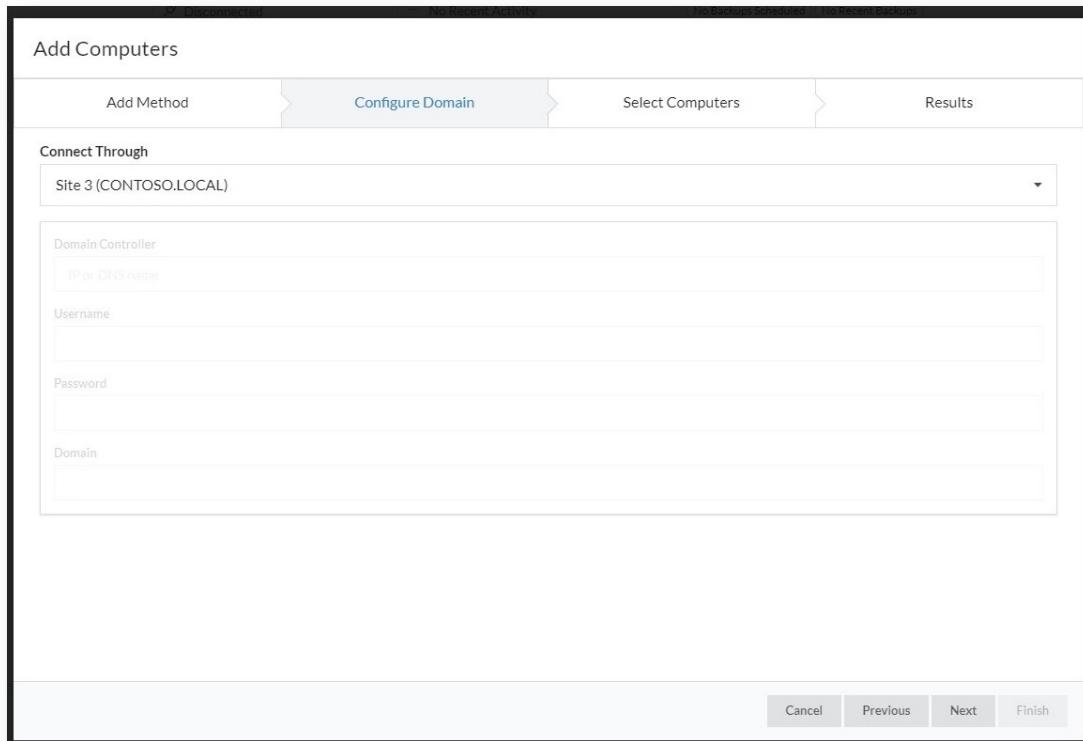

Computers are added to Site Manager using the Add Computers Wizard which can be accessed from the computers page.

Site Manager uses NetBIOS names to uniquely identify computers (though connections are over TCP/IP). This means that a NetBIOS name must be provided before a computer can be added to Site Manager. However, Site Manager provides multiple ways to lookup a computer's NetBIOS name for user convenience.

# Macrium Site Manager User Guide

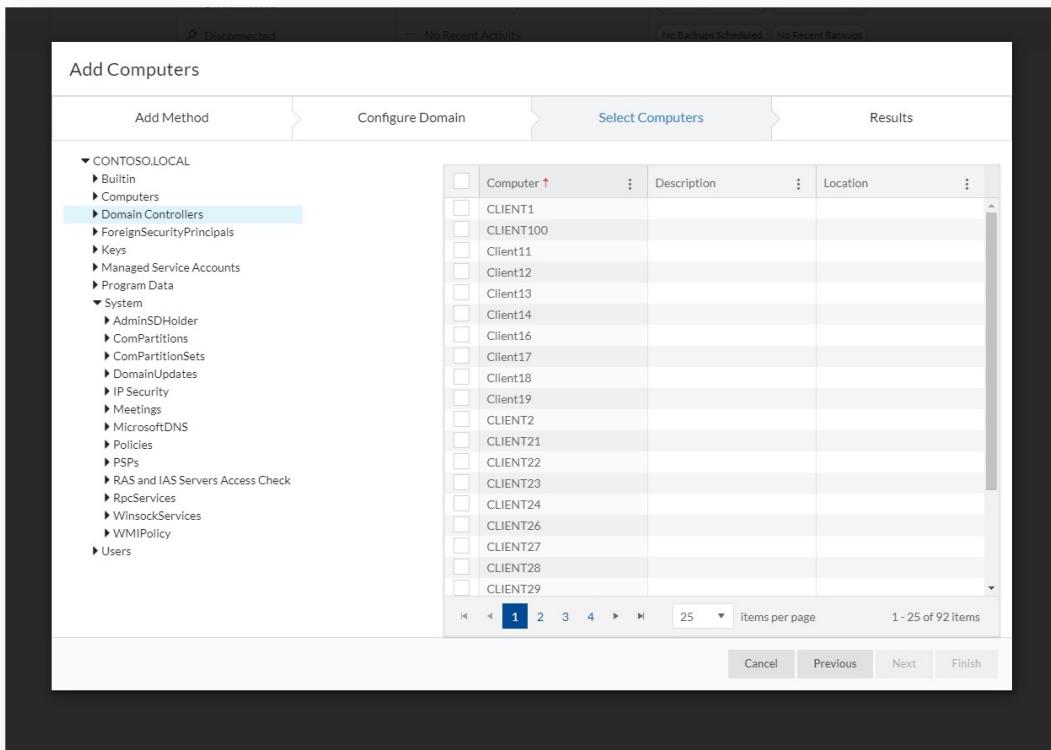

## Domain Computers

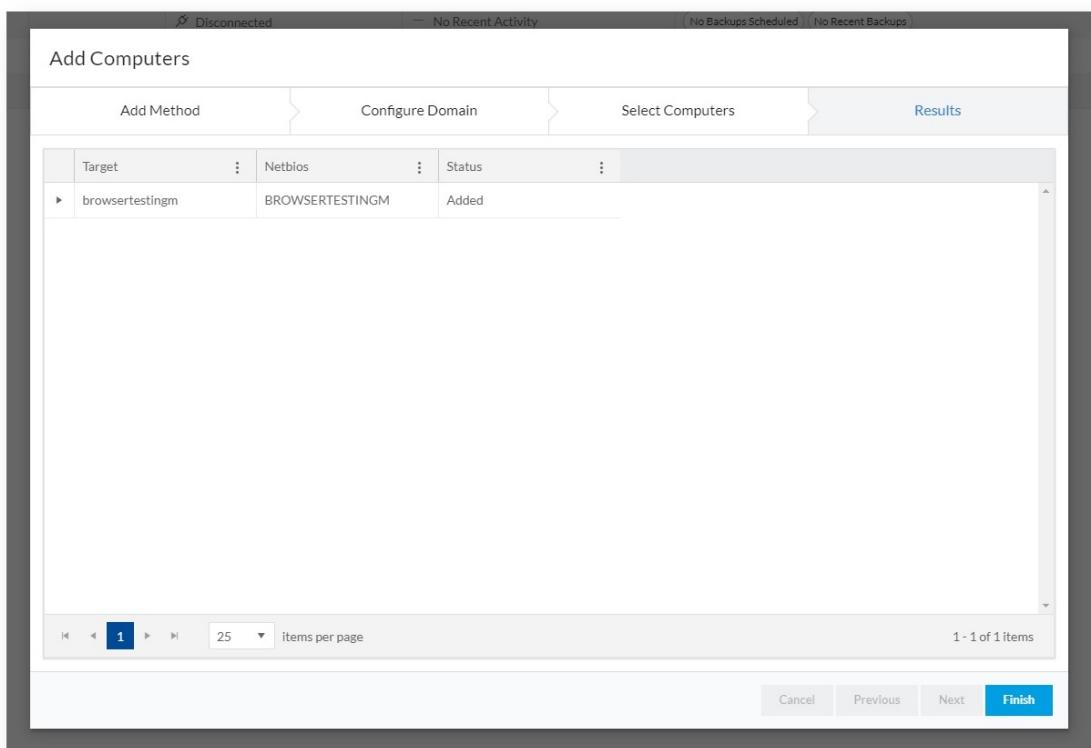

The screenshot shows the 'Add Computers' wizard in progress, specifically the 'Configure Domain' step. The interface is a clean, modern design with a light gray background and white input fields. At the top, a navigation bar indicates the current step: 'Configure Domain' (highlighted in blue) is the second step in a four-step process. The 'Add Method' step is completed, and the 'Select Computers' and 'Results' steps are yet to come. The 'Configure Domain' step contains several input fields: a dropdown menu for 'Connect Through' (set to 'Site 3 (CONTOSO.LOCAL)'), and four text input fields for 'Domain Controller' (IP or DNS name), 'Username', 'Password', and 'Domain'. At the bottom of the step, there are four buttons: 'Cancel', 'Previous', 'Next', and 'Finish'.

Site Manager can search Active Directory to find domain computers. To set up a connection with Active Directory, users can choose a domain login provider or enter the connection details manually. For a manual connection, enter the name of the domain controller and the credentials of a user authorised to perform searches (the domain field is used in domain forests where the domain of user differs from the target domain). The connection will be verified before the next step of the wizard.

# Macrium Site Manager User Guide

The tree on the left can be used to navigate the domain and computers contained within the selected organisational unit are displayed in the table. Selected computers will be added to Site Manager.

# Macrium Site Manager User Guide

The final page displays the computers which have been added to Site Manager.

## Network Computers

Site Manager can search for computers on the network it is connected to. Users can select computers from the search results to be added to Site Manager.

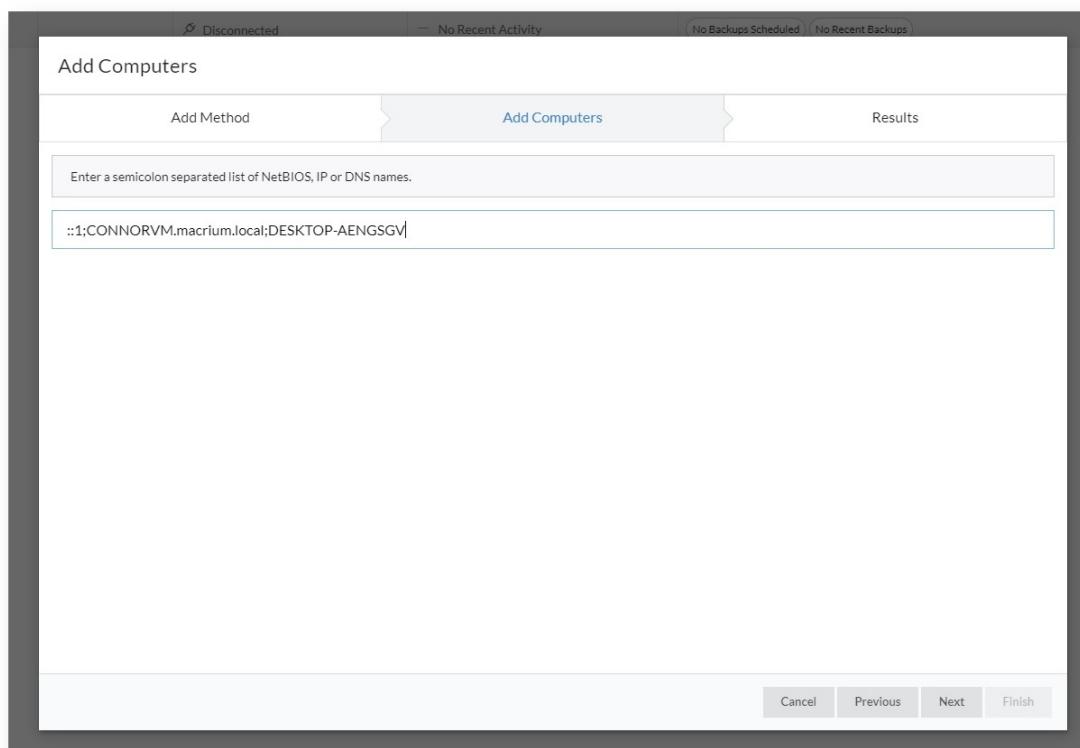

### Add Computers Trying to Connect to Site Manager

Agents which have been configured to communicate with a given Site Manager server will have already setup a communication channel. The computer still needs to be added for Site Manager to manage it.

This option will list all computers which has an agent configured to seek the Site Manager server. Users can select computers to be added from the table.

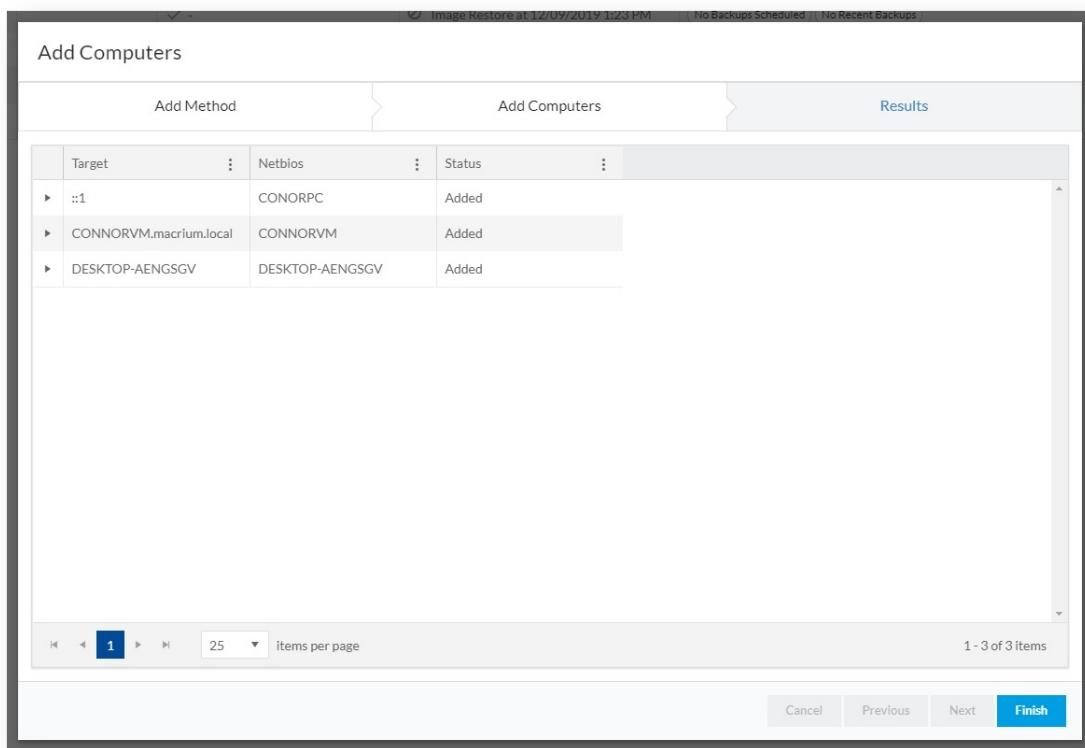

If there are no computers seeking a connection with Site Manager then this option is disabled.

### Adding Computers Manually

Computer can be added manually if the user knows the NetBIOS or DNS name or the IP address (IPv4 or IPv6) of the target computer. DNS names and IP addresses will be resolved to a NetBIOS name by Site Manager. Multiple computers can be added if they are separated by semicolons (;); whitespace is ignored.

# Macrium Site Manager User Guide

The table reports the success of name resolution; agents with resolved NetBIOS names are added to Site Manager. Unsuccessful IP lookups will also be reported. Note that NetBIOS and DNS names are not checked to allow offline computers to be added.

## Installing the Site Manager Agent

Adding a computer to Site Manager will add the computer in the **Disconnected** state unless the computer has had the Site Manager Agent installed and configured to connect to this Site Manager Server.

This can be done remotely via the Site Manager user interface or manually by installing the Site Manager Agent MSI installer.

## Installing the Agent via Remote Install

If Site Manager is on a domain or the appropriate steps have been followed, the Agent software can be remotely installed on the client to be managed. See [Troubleshooting Agent Communications](#) for a detailed guide to network and firewall requirements for this process.

## Steps to Remote Install

### Installation Credentials

Administrator level access to the computer is required to install an Agent. If available, the credentials used to log in to Site Manager will be used. If Site Manager is configured to allow anonymous access, the installation process will prompt for credentials before attempting install.

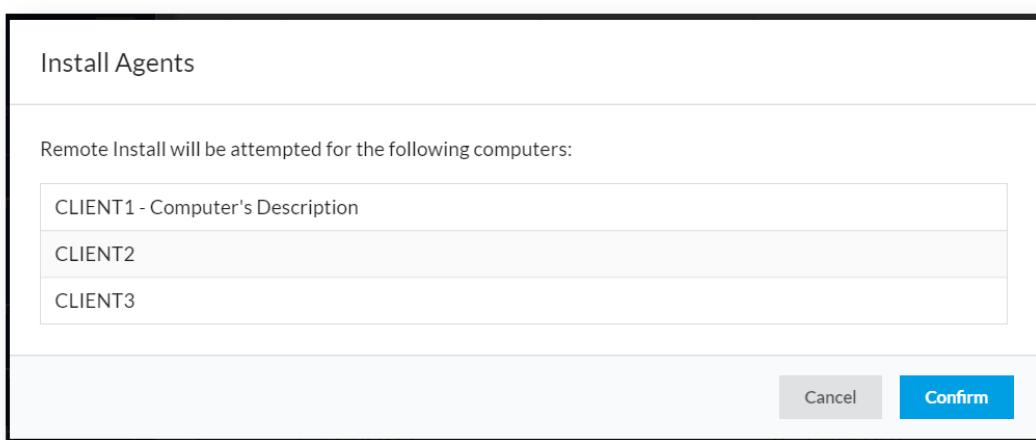

# Macrium Site Manager User Guide

Additional credentials may be configured in the **Settings** page.

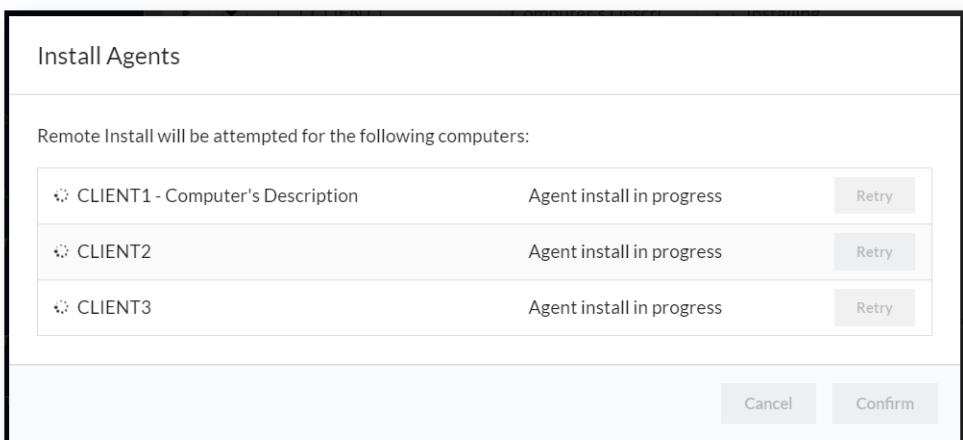

- Select the computers to perform a remote install on.

▶	<input checked="" type="checkbox"/>	 CLIENT1	Computer's Descri...
▶	<input checked="" type="checkbox"/>	 CLIENT2	
▶	<input checked="" type="checkbox"/>	 CLIENT3	

- Press the **Install Agent** button in the toolbar.
- Select 'Confirm' in the dialog that pops up to attempt to install or cancel to exit.

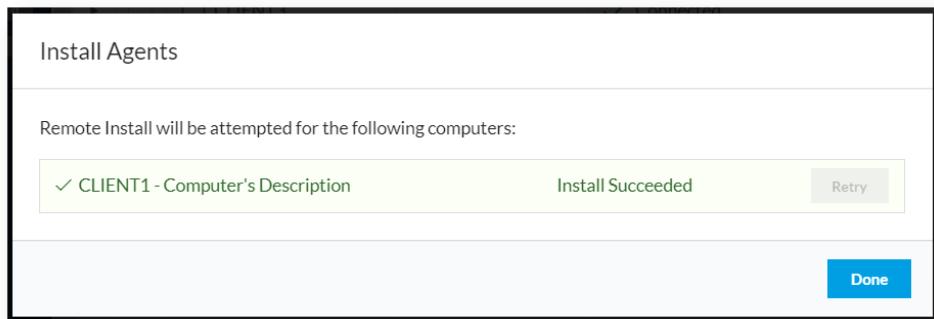

- Site Manager will attempt the install and show the status of each computer.

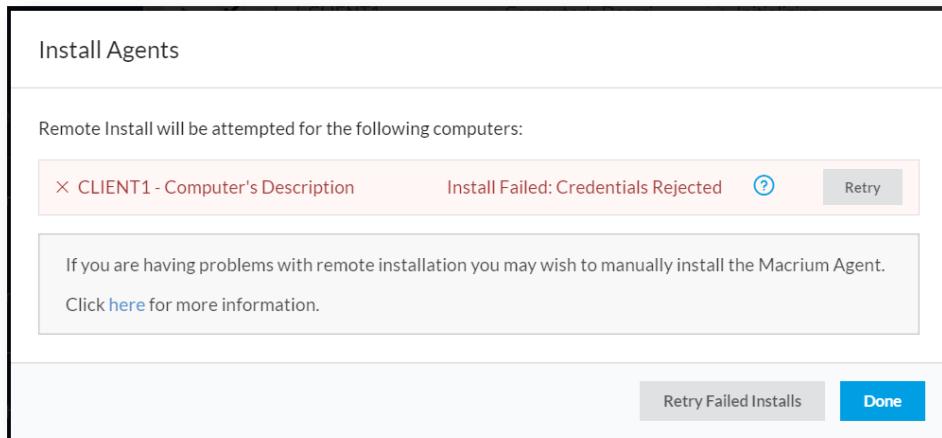

# Macrium Site Manager User Guide

- Once each install has finished, the status will be displayed. If all computers succeeded then only 'Done' will be available

## Problems with Remote Installation

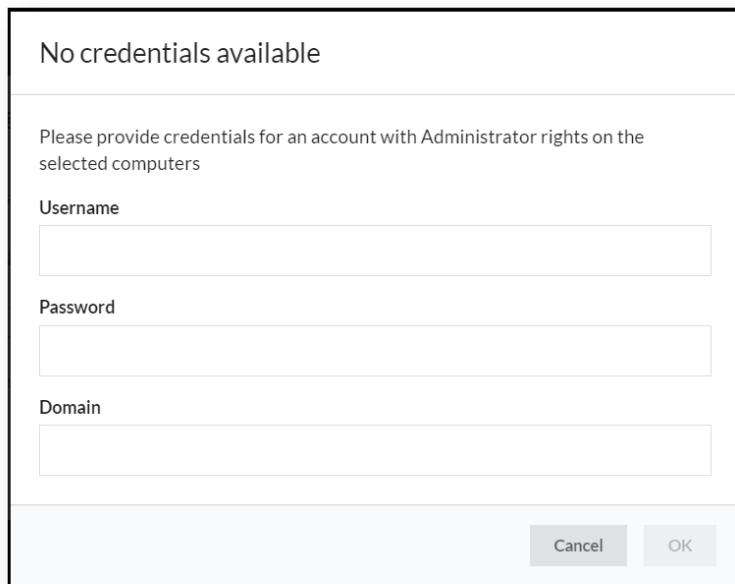

If there are any issues in installing the agent on any computer, this will be shown in the results:

All failed installs can be retried simultaneously via the **Retry Failed Installs** button or on an individual computer basis by using the **Retry** buttons in the table next to the install status. Each failed computer has a help icon that can be clicked to provide detailed information about the failure.

If retrying the installation on a computer (or computers) which failed the install due to credential errors, Site Manager will prompt for new credentials:

# Macrium Site Manager User Guide

Once new credentials have been entered and **OK** pressed, reinstallation will be attempted using the new credentials.

Other possible errors are:

Install Error	Description	Recommended Action
No Credentials Available	The installation cannot proceed because there are no cached credentials to try. This only occurs when attempting the install when the Management Console is set to allow anonymous login and the password prompt is cancelled on attempting the install	Retry the install and enter credentials when prompted
Credentials Rejected	None of the entered or cached credentials were accepted by the computer as valid.  <div style="border: 1px solid #ccc; padding: 5px; margin-left: 20px;"><span style="color: #0070C0; font-size: 1.5em; margin-right: 5px;">i</span> This may occur if the computer is not part of a domain and the computer is configured to only allow unelevated access remotely.</div>	Retry the install with different credentials or attempt a manual installation.
Remote Install Not Available	The install process connected to the WMI server successfully, but the WMI installer component is not installed. This typically occurs on Windows XP machines as later editions have this component installed automatically.	Install the Remote Installer WMI component on the remote machine and try again.
WMI Not Available	Could not find a WMI process to connect to. Either the computer is offline, not a Windows machine or WMI remote access is blocked for security reasons	

# Macrium Site Manager User Guide

Install Error	Description	Recommended Action
		Check the computer status and try again or manually install the agent.
Operating System too old	The computer connected but is below the Windows version required for the Agent.	Upgrade the OS on the computer or use a different computer.
Installer Error - 1234	The installer ran, but returned an error code and was not successful. The number in place of 1234 is the code from the installer	Contact Macrium support or try a manual install.
Install Failed	A general failure in installation.	Retry the install or contact Macrium support.
Computer not present on network	The computer name could not be resolved to an IP address by either DNS lookup or LLMNR broadcast.	Check that the computer is present on the network and that DNS is correctly configured
File sharing unavailable	The computer IP address could be looked up, but an attempt to connect to the Windows administrative share failed (\\\computername\admin\$)	Check that the computer is present on the network and that Windows share traffic is not blocked

## Installing the Agent Manually

If Remote Install is not available, the Agent can be installed manually. See [Agent Manual Install](#) for more details.

## Adding Computers With Agents Preinstalled

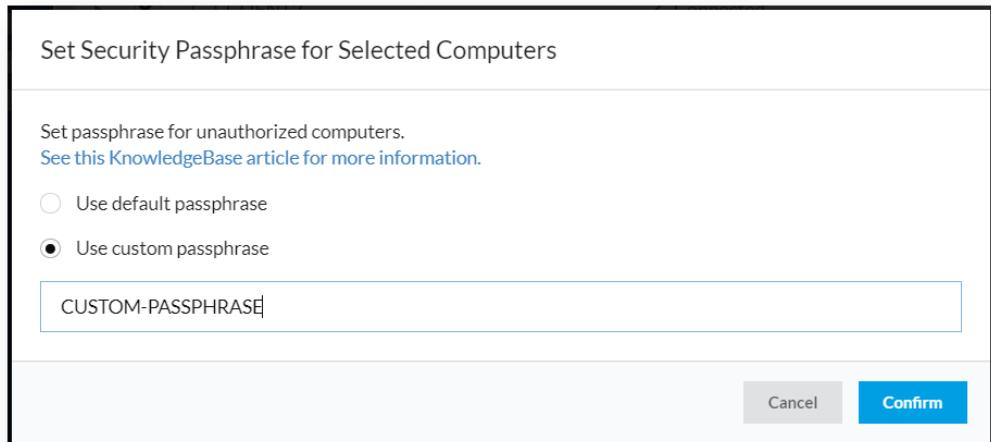

When a Site Manager Agent is installed, it is configured with the information required to access the Site Manager server. This is provided automatically when the Agent is installed via the Site Manager **Install Agent** function or manually if the Agent has been installed via MSI installer file. If the Agent is properly configured, it will enter the **Connected** state automatically when added to Site Manager. If the Agent has been configured with the incorrect details (or details for another Site Manager server), the agent must be reconfigured by either reinstalling the Agent via the **Install Agent** function or running the Agent Configuration Tool on the Agent itself.

If the Site Manager has been configured with a different security passphrase than the one configured in the Security Settings page of the Site Manager server, it will enter the **Unauthorized** state.

# Macrium Site Manager User Guide

To fix this and manage the agent, you can set the correct passphrase on the Agent using the Agent Configuration Tool, reinstall the Agent (remotely or manually) which will reset the passphrase, or supply the old passphrase in Site Manager. When this is done, Site Manager will connect to the agent using the old passphrase and update the passphrase to the appropriate one for the current installation.

To set the passphrase, select the computers by checking the appropriate box in the computers list and press the **Set Passphrase** button in the "More Actions" dropdown. This will open the passphrase editing dialog:

To set a passphrase, check the **Use custom passphrase** option and enter the passphrase in the box. Press **CONFIRM** to apply the passphrase.

If the passphrase is correct, the computer will connect. If it is incorrect an error will be shown:

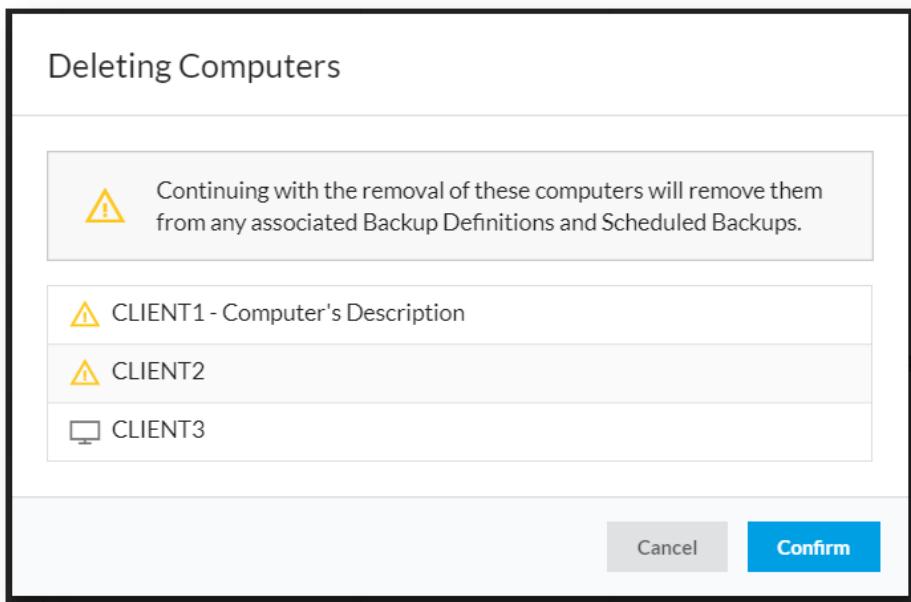

## Deleting Clients from Site Manager

To delete computers from Site Manager, select the computers to delete via the checkboxes and press the **Delete** button in the toolbar:

This will bring up a confirmation dialog box, including information of any computers which are part of currently scheduled backups or Backup Definitions:

# Macrium Site Manager User Guide

To remove these computers, press **Confirm**.

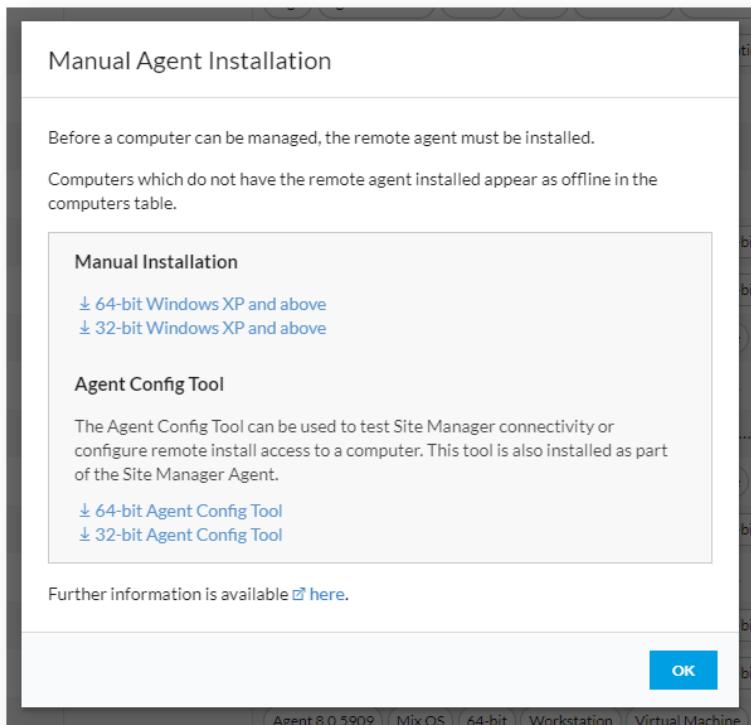

## Running the Installer

If your network is not part of a Windows domain or if you are unable to remotely install the Macrium Remote Agent then you can manually install the agent on the remote computer.

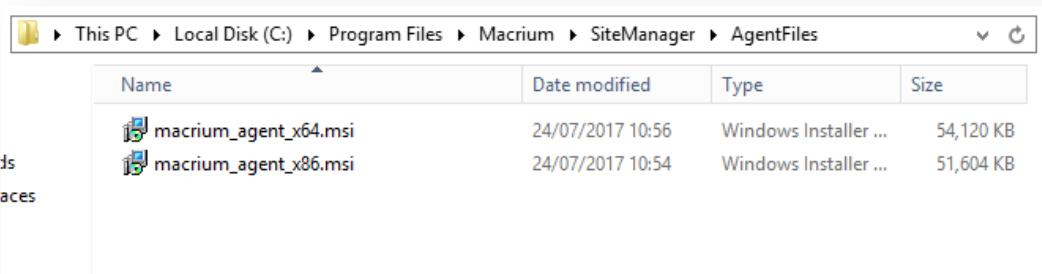

The agent MSI installer can be downloaded via the Site Manager interface on the Computers page - the option **More Actions > Manual Agent Installation** has links to the .msi files for installing agents as shown below:

The screenshot shows the 'Computers' page in the Macrium Site Manager interface. The left sidebar shows 'Site Configuration' is selected. The main area displays a table of computers: CLIENT1, CLIENT2, and CLIENT3. A 'More Actions' menu is open for CLIENT3, with the 'Manual Agent Installation' option highlighted with a green box.

# Macrium Site Manager User Guide

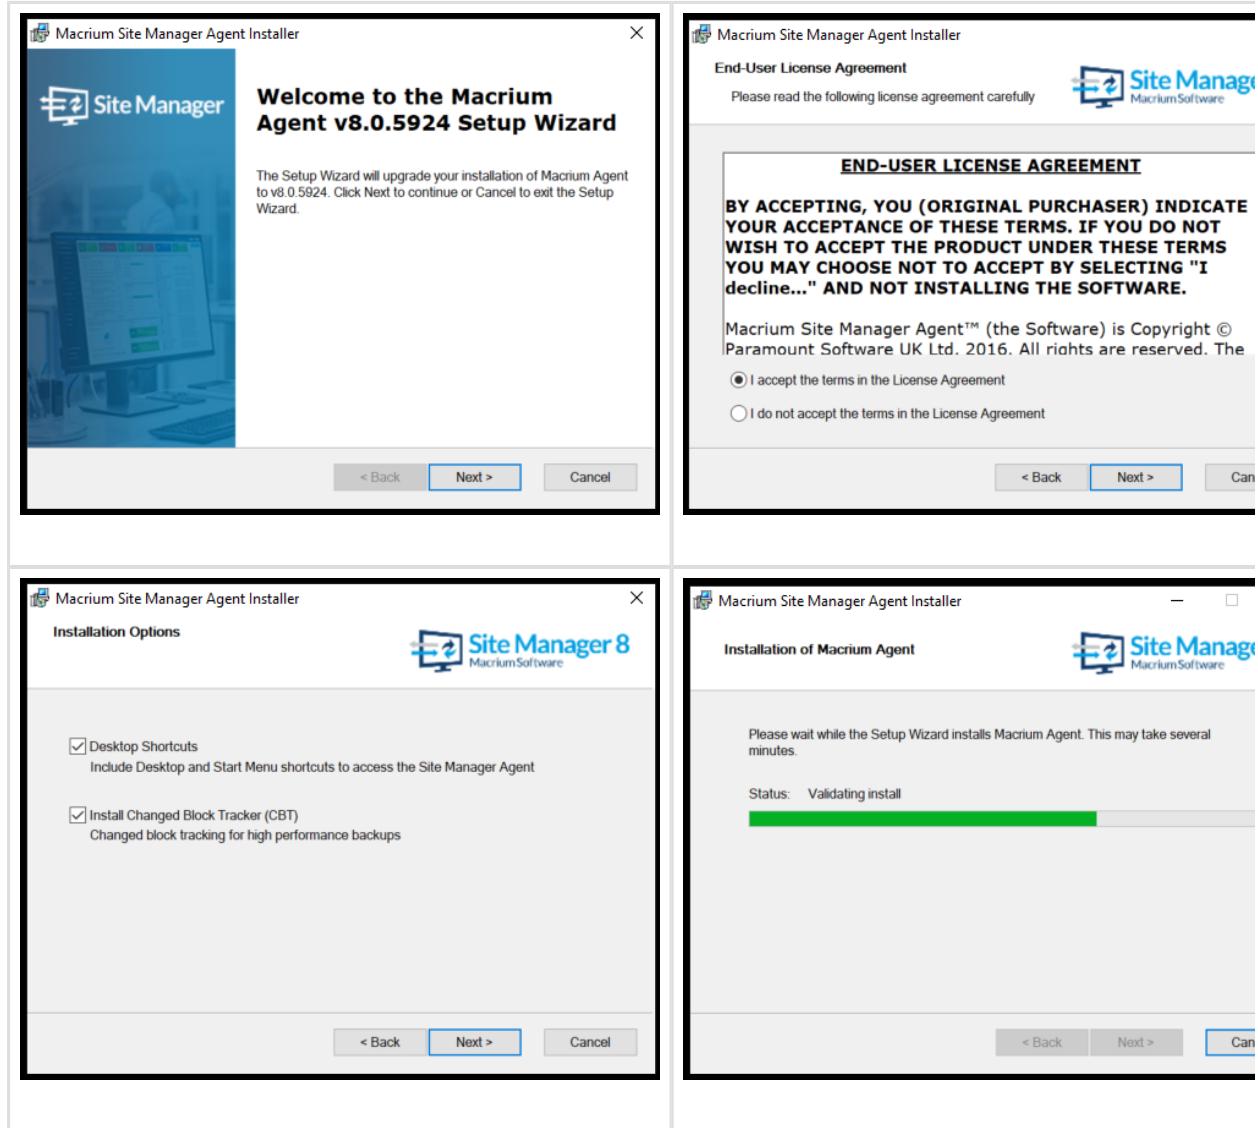

Alternatively, the agent .msi installer can be found on the Site Manager server in folder: **C:\Program Files\Macrium\SiteManager\AgentFiles**

Copy either 'macrium\_agent\_x64.msi' (64 Bit) or 'macrium\_agent\_x86.msi' (32 Bit) to the client PC and run by **double clicking in Windows Explorer**.

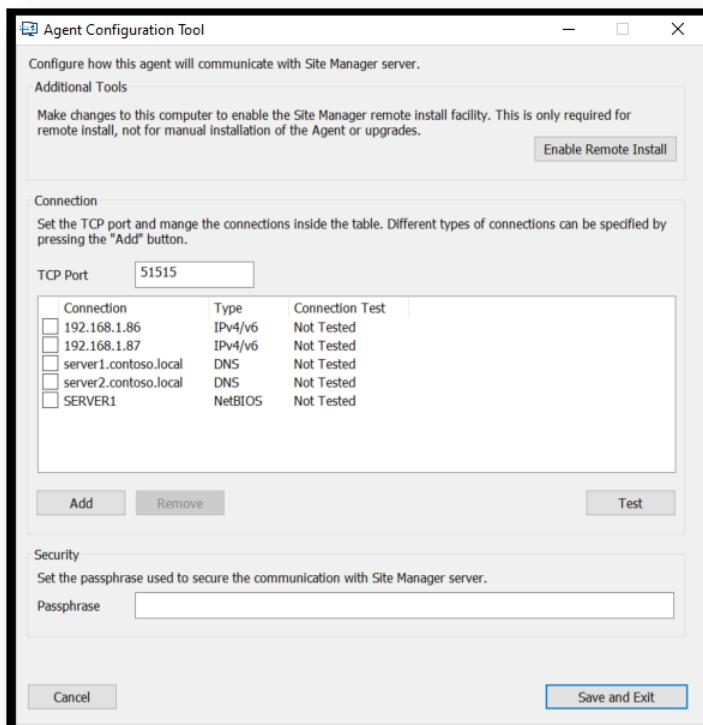

# Macrium Site Manager User Guide

The **Desktop Shortcuts** option controls whether the installer will create desktop or start menu shortcuts. The **Install Changed Block Tracker (CBT)** option will install the CBT driver, which is used by the Macrium Reflect backup engine to increase the backup performance of incremental backups. This option will be disabled if the computer's OS cannot support this driver.

Once the install has completed, the Agent Configuration Tool will automatically run to configure the Agent's connection to the Site Manager server. See [Troubleshooting Agent Communications](#) for more details.

# Macrium Site Manager User Guide

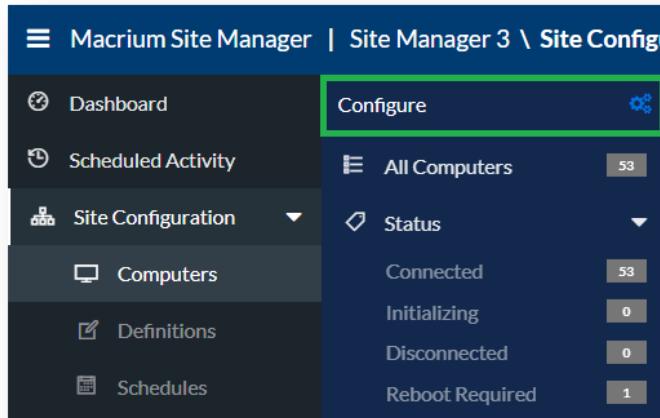

The connection to the Agent can be automatically configured in the MSI installer by using the MSI command line switches described in [Deploying Site Manager Agents Using SCCM](#)

## Groups and Tags

The screenshot shows the 'Groups and Tags' page in the Macrium Site Manager interface. The left sidebar has a 'Site Configuration' section with 'Computers' selected, showing 'Definitions', 'Schedules', 'Repositories', 'Restore', 'Remote Restore', 'Rescue Media', 'Other Tasks', 'Verification', and 'Logs'. The main area has a 'Groups and Tags' title with 'Custom Groups and Tags' and 'Configure Visibility' buttons. A 'New Group' button is highlighted. Below is a table for 'A Custom Group' with columns 'Tag' and 'Computers'. It shows one entry: 'Tag4' with '1' computer. To the right is another table for 'Department' with columns 'Tag' and 'Computers'. It shows five entries: 'Accounts' (4 computers), 'Development' (3 computers), 'IT' (5 computers), 'Reception' (1 computer), and 'Secret Laboratory' (3 computers). Each entry has a 'More' button (three dots) to its right.

# Macrium Site Manager User Guide

This page can be accessed by clicking on **Configure** on the **Computers** page.

A **Group** can contain multiple **Tags**. Those Tags can be assigned to different Computers to organize them in various ways.

There are two types of Tags:

- **Automatic Groups and Tags:** Computers have Tags assigned to them dynamically (e.g., Status, Backup Definitions).
- **Custom Groups and Tags:** Tags created by the user.

In this page, you can create, edit and delete groups and tags, assign tags to computers and configure their visibility on the side menu or/and on the tags column on computers page.

## Automatic Groups and Tags

There are tags that are automatically assigned to computers:

Group Name	Description
Computer Information	General computer information such as 32- or 64-bit, UEFI, Virtual machine status
Operating System	The version of Windows running on the Agent
Status	The Site Manager connection status of the Agent: <ul style="list-style-type: none"><li>• Connected</li><li>• Connected (with Errors)</li><li>• Initializing</li><li>• Disconnected</li><li>• Migrating</li><li>• Installing</li></ul>

# Macrium Site Manager User Guide

Group Name	Description
	<ul style="list-style-type: none"> <li>• Upgrading</li> <li>• Unauthorized</li> <li>• Unlicensed</li> <li>• Patch Failed</li> <li>• Reboot Required</li> <li>• Upgrade Required</li> </ul>
<b>Agent Health</b>	Any backup health checks the Agent has failed: <ul style="list-style-type: none"> <li>• No Backups Scheduled</li> <li>• Last Backup Failed</li> <li>• No Recent Backups</li> </ul>
<b>Domain</b>	The Active Directory Domain the Agent is joined to
<b>Domain OU</b>	The Organizational Unit of the computer's account in Active Directory
<b>Backup Definitions</b>	The Backup Definitions this computer is a part of - there will be one tag per Backup Definition
<b>License Status</b>	Whether the computer is unlicensed, licensed via an Agent license or via a standalone Macrium Reflect 8 license.  There is an additional status <b>Awaiting Connection</b> for computers which have never connected to Site Manager and therefore do not have any license status
<b>Agent Version</b>	The version of Site Manager Agent installed on the computer
<b>Reflect Version</b>	The version of standalone Reflect (if any) installed on the computer
<b>Reflect Edition</b>	The edition of standalone Reflect (if any) installed on the computer (Workstation, Server, Server Plus etc)
<b>Domain Groups</b>	One tag will be added here for each security or distribution group that a computer's AD account is a member of
	If there is an Agent user script disabling backups on this computer, the computer will have a <b>Scheduled Backups Disabled</b> tag

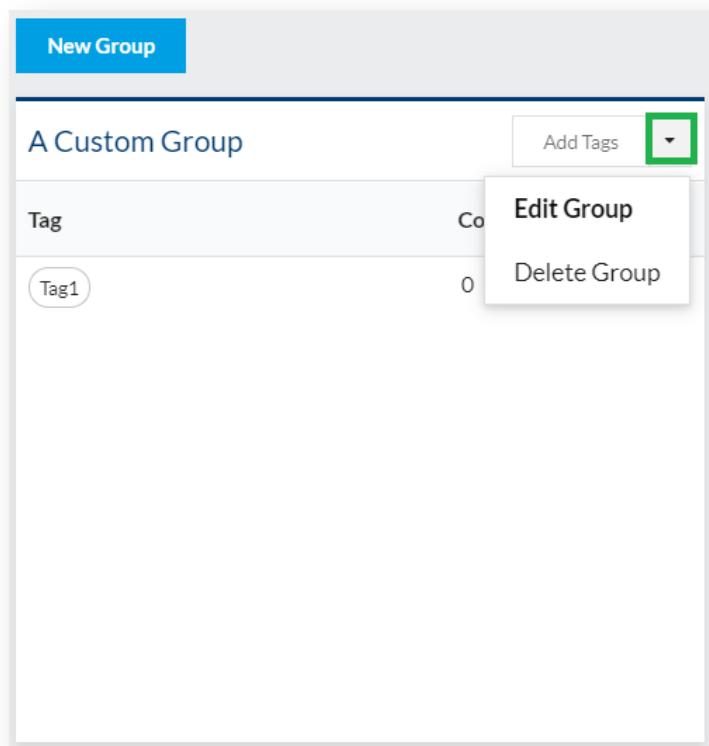

# Macrium Site Manager User Guide

Group Name	Description
Agent Operating Mode	
Activity	If there is an active backup or restore on a computer, it will have a <b>Operation in Progress</b> tag

Note - automatic groups are only shown if there is one or more computers which have a tag in that group present

## Custom Groups

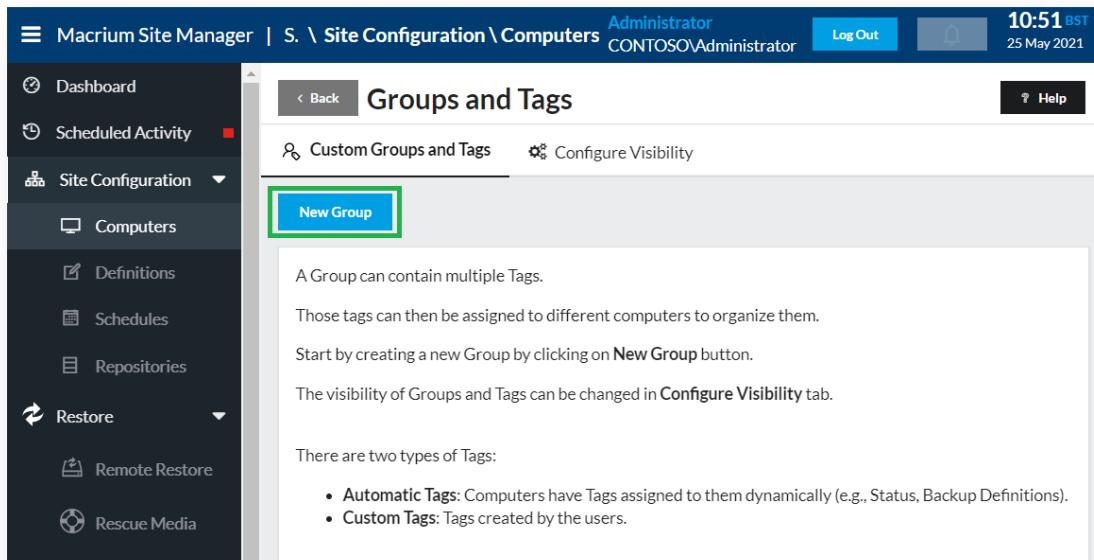

From this view, a group can be added, edited and removed as well as add tags to it.

### Add a Group

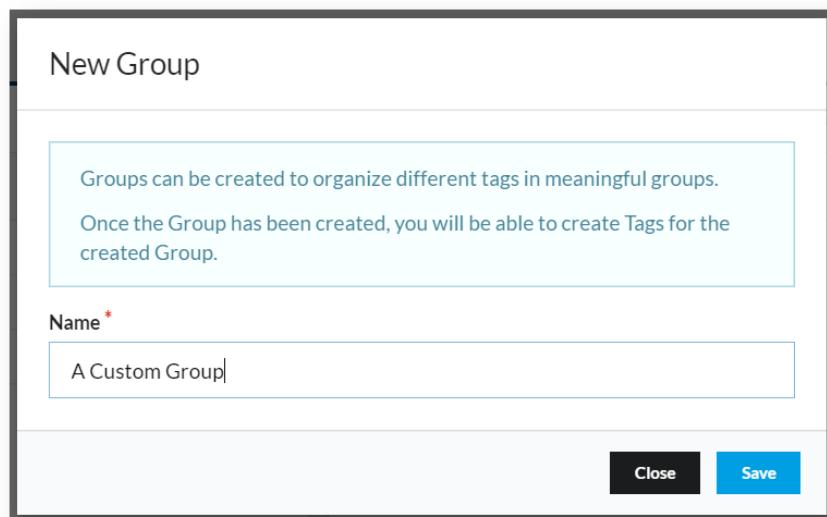

To add a new group, click on the "New Group" button.

# Macrium Site Manager User Guide

The screenshot shows the Macrium Site Manager interface. The top navigation bar includes 'Administrator' (CONTOSO\Administrator), 'Log Out', a bell icon, and the date '25 May 2021'. The top right corner shows the time '10:51 BST'. The left sidebar has a 'Computers' section selected, with sub-options: 'Definitions', 'Schedules', 'Repositories', 'Restore' (with 'Remote Restore' and 'Rescue Media' sub-options), and a 'New Group' button highlighted with a green box. The main content area is titled 'Groups and Tags' and shows a sub-section 'Custom Groups and Tags'. It includes a 'Configure Visibility' link, a 'New Group' button, and a text box explaining that a Group can contain multiple Tags, which can be assigned to different computers. It also mentions 'Automatic Tags' and 'Custom Tags'. A note states: 'A dialog will prompt for the group's name.'

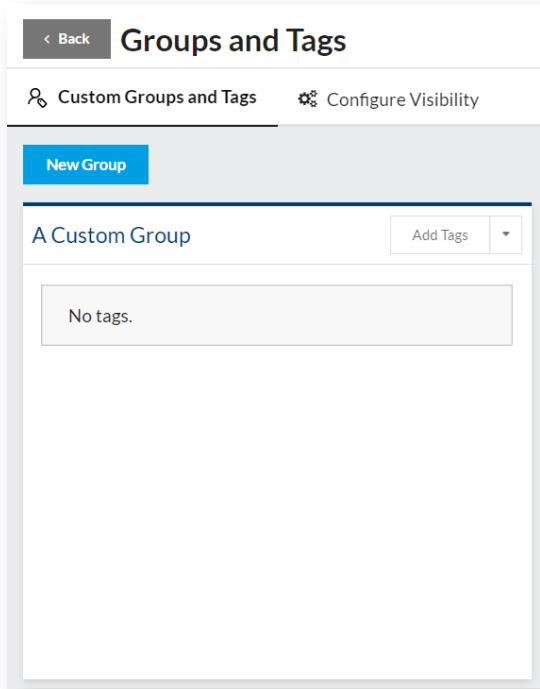

A dialog will prompt for the group's name.

The dialog box is titled 'New Group'. It contains a descriptive text box: 'Groups can be created to organize different tags in meaningful groups. Once the Group has been created, you will be able to create Tags for the created Group.' Below this is a 'Name \*' field with the value 'A Custom Group'. At the bottom are 'Close' and 'Save' buttons.

Click "Save" to create the group.

# Macrium Site Manager User Guide

The screenshot shows the 'Groups and Tags' interface. At the top, there are buttons for 'Custom Groups and Tags' and 'Configure Visibility'. A blue 'New Group' button is prominent. Below it, a group named 'A Custom Group' is listed, with an 'Add Tags' button and a dropdown menu. A message 'No tags.' is displayed in a box.

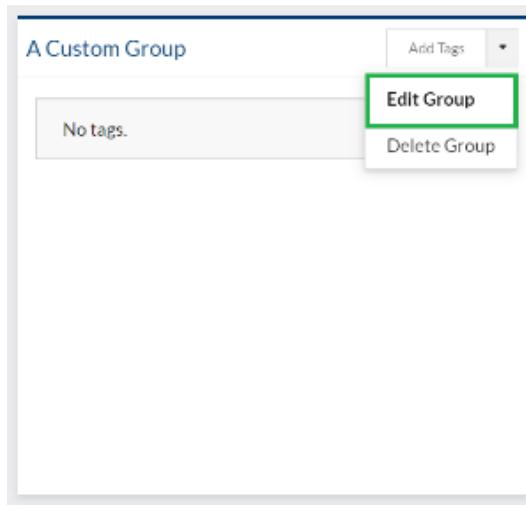

The group's name needs to be unique.

Once the group has been created successfully, tags can be added to it. [Click here](#) to know more.

## Edit a Group

To edit a group, click on "Edit Group" and it will prompt for a new group name.

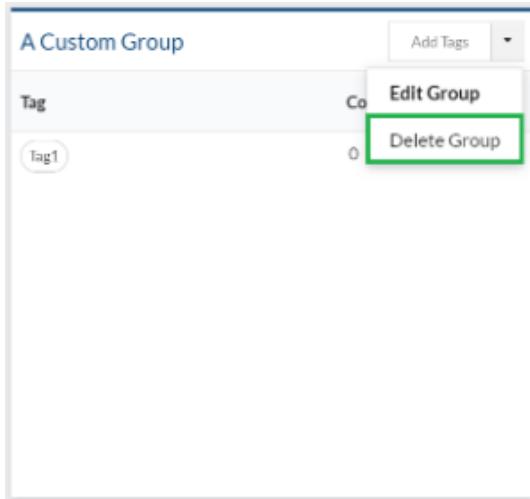

The screenshot shows the 'A Custom Group' page. A context menu is open with options 'Edit Group' (highlighted with a green box) and 'Delete Group'.

## Delete a Group

To delete a group, click on "Delete Group". A confirmation dialog will open to confirm or cancel the action.

# Macrium Site Manager User Guide

The group will be deleted as well as all the tags related to the group. Tags associated with this group will be removed from the computers.

## Custom Tags

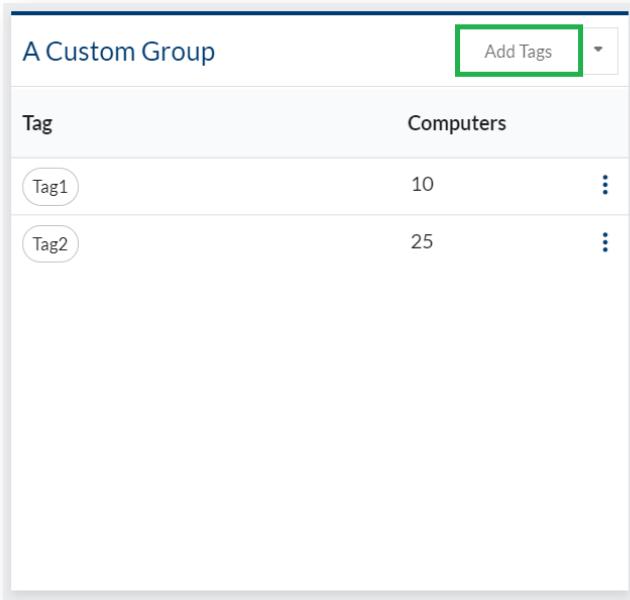

Custom tags can be added to different groups.

A screenshot of the Macrium Site Manager interface showing two groups: 'A Custom Group' and 'Department'. Both groups have an 'Add Tags' button at the top right. The 'A Custom Group' table shows five tags: Tag1 (10 computers), Tag2 (25 computers), Tag3 (0 computers), Tag4 (4 computers), and Tag5 (0 computers). The 'Department' table shows five tags: Accounts (4 computers), Development (3 computers), IT (5 computers), Reception (1 computer), and Secret Laboratory (3 computers). Each tag row has a three-dot menu icon on the right.

## Add Tags

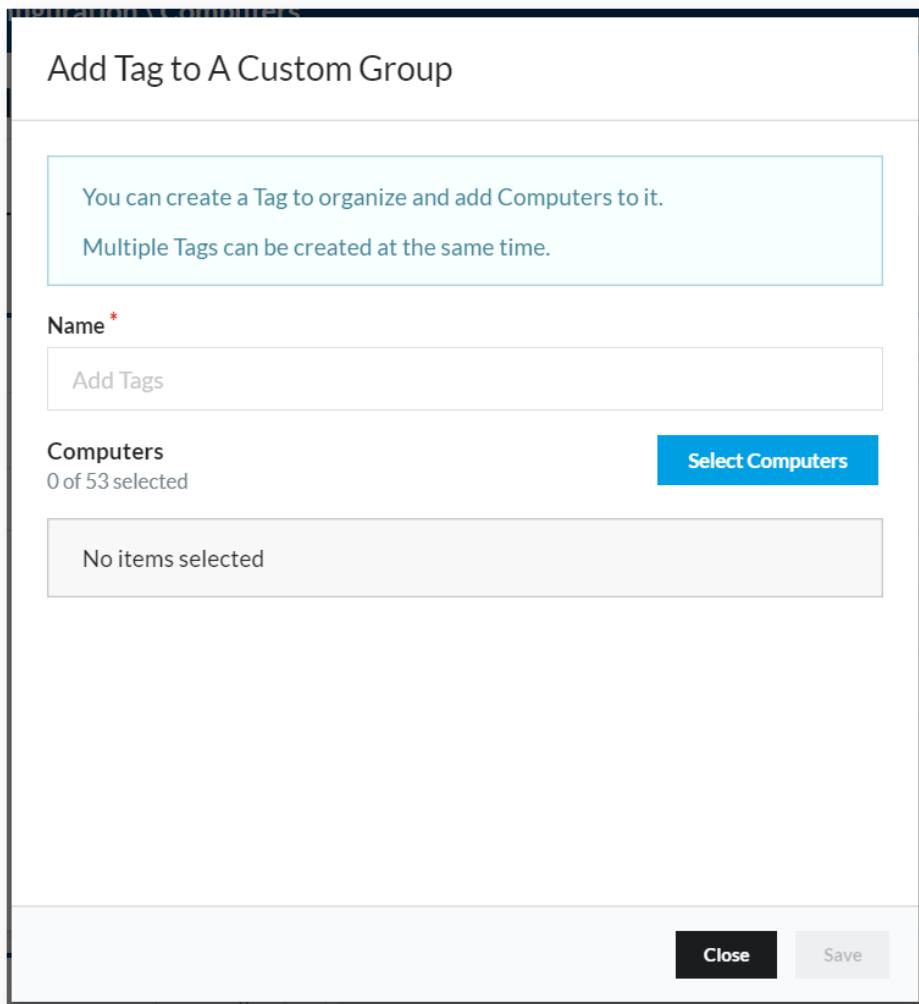

To add tags to a group, look for the group you want to add tags to and click on "Add Tags".

# Macrium Site Manager User Guide

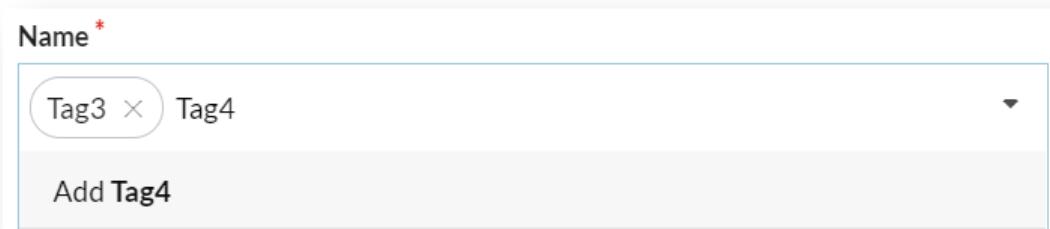

A dialog will prompt for the tag's name and the computers that will be assigned with it.

# Macrium Site Manager User Guide

## Tags

Multiple tags can be added at the same time. Press "Enter" or click on the "Add" option.

If the tag hasn't been added to the input, it will show as an error. Click on the input and follow the instruction above.

# Macrium Site Manager User Guide

Name \*

×

▼

If a tag already exists in the group, the tag cannot get added.

Name \*

×

▼

Tag already exists

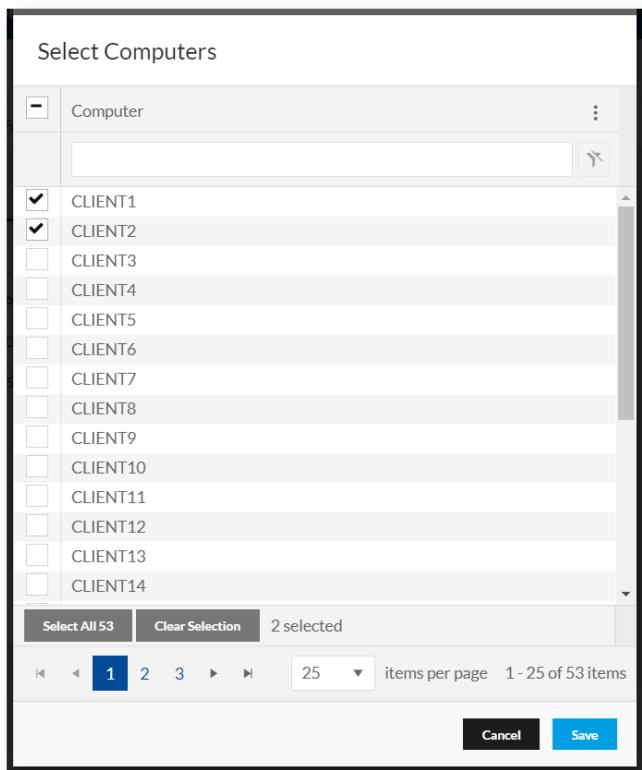

To delete a tag so it doesn't get added, click on the *x* icon.

## Select Computers

The next step is to select the computers that will have the tags assigned to them. Click on "Select Computers" to open the selection dialog and select the computers.

Select Computers

# Macrium Site Manager User Guide

Click on "Save" to confirm and the selected computers will be shown:

Computers  
2 of 53 selected

CLIENT1

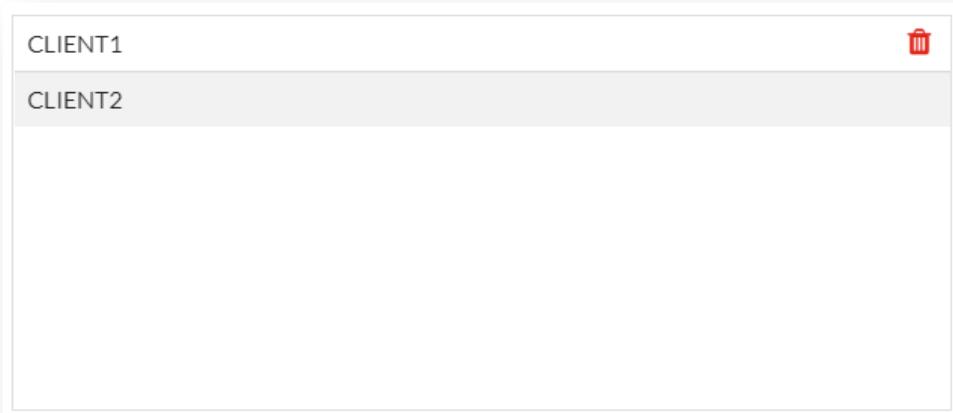

CLIENT2

Select Computers

To edit the select computers, click on "Select Computers" again.

If you hover over a computer row, the computer can be quickly deleted.

# Macrium Site Manager User Guide

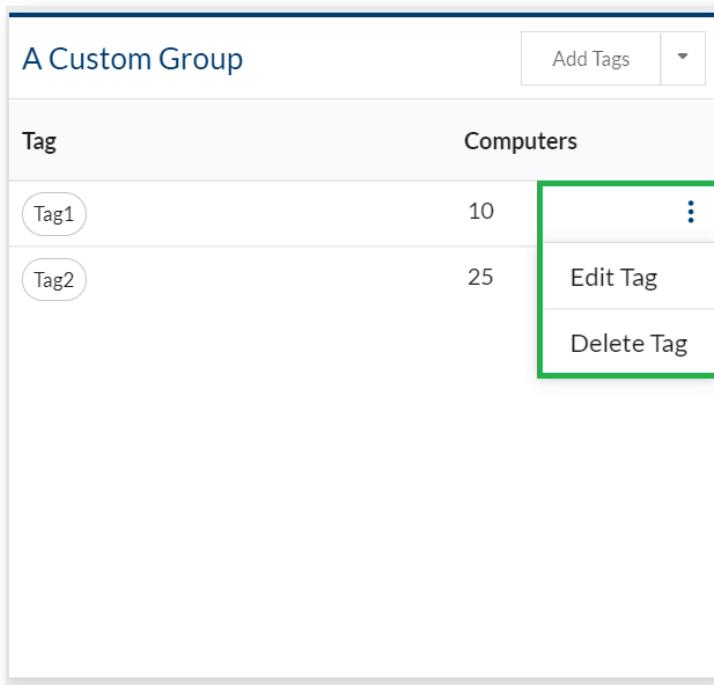

Click "Save" to confirm to create the tags and assign them to the selected computers.

The tags names need to be unique within the same group.

## Edit Tag

To edit a tag click on the icon to open the tags options and click on "Edit Tag" to open the edit form.

From this view, the tag's name can be edited and the selected computers can be changed.

# Macrium Site Manager User Guide

Edit Tag - Tag1

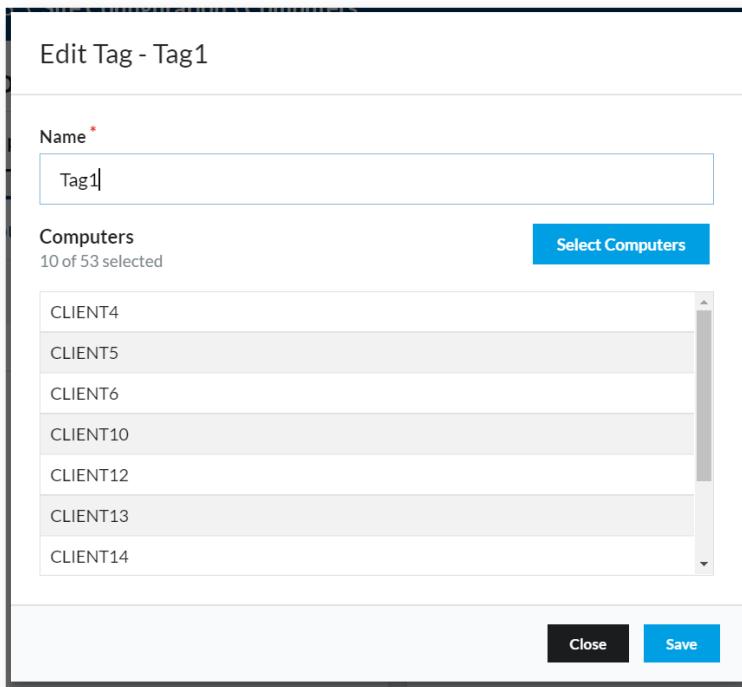

Name \*

CLIENT6  
CLIENT10  
CLIENT12  
CLIENT13  
CLIENT14

Select Computers

Close Save

## Delete Tag

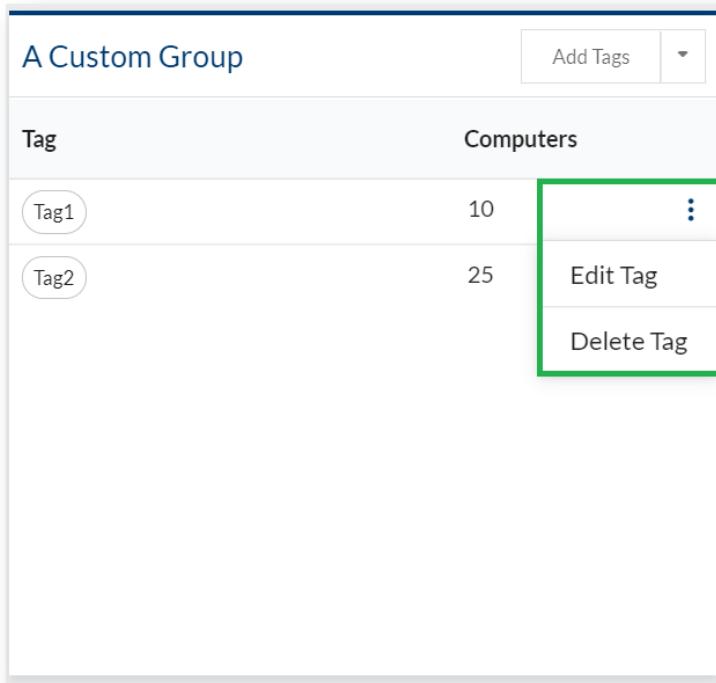

To delete a tag click on the  icon to open the tags options and click on "Delete Tag".

A Custom Group

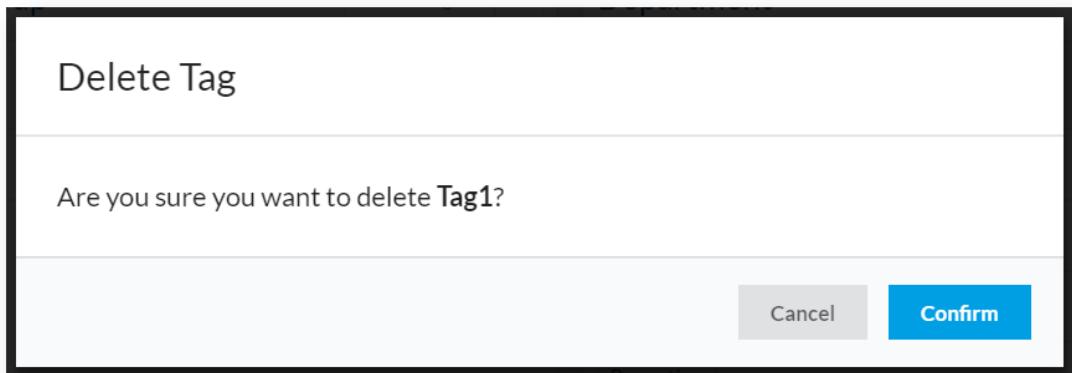

Add Tags

Tag	Computers
Tag1	10
Tag2	25

 Edit Tag  
Delete Tag

A confirmation box will appear to confirm or cancel the deletion.

The tag will be removed from the group and from the computers previously associated with it.

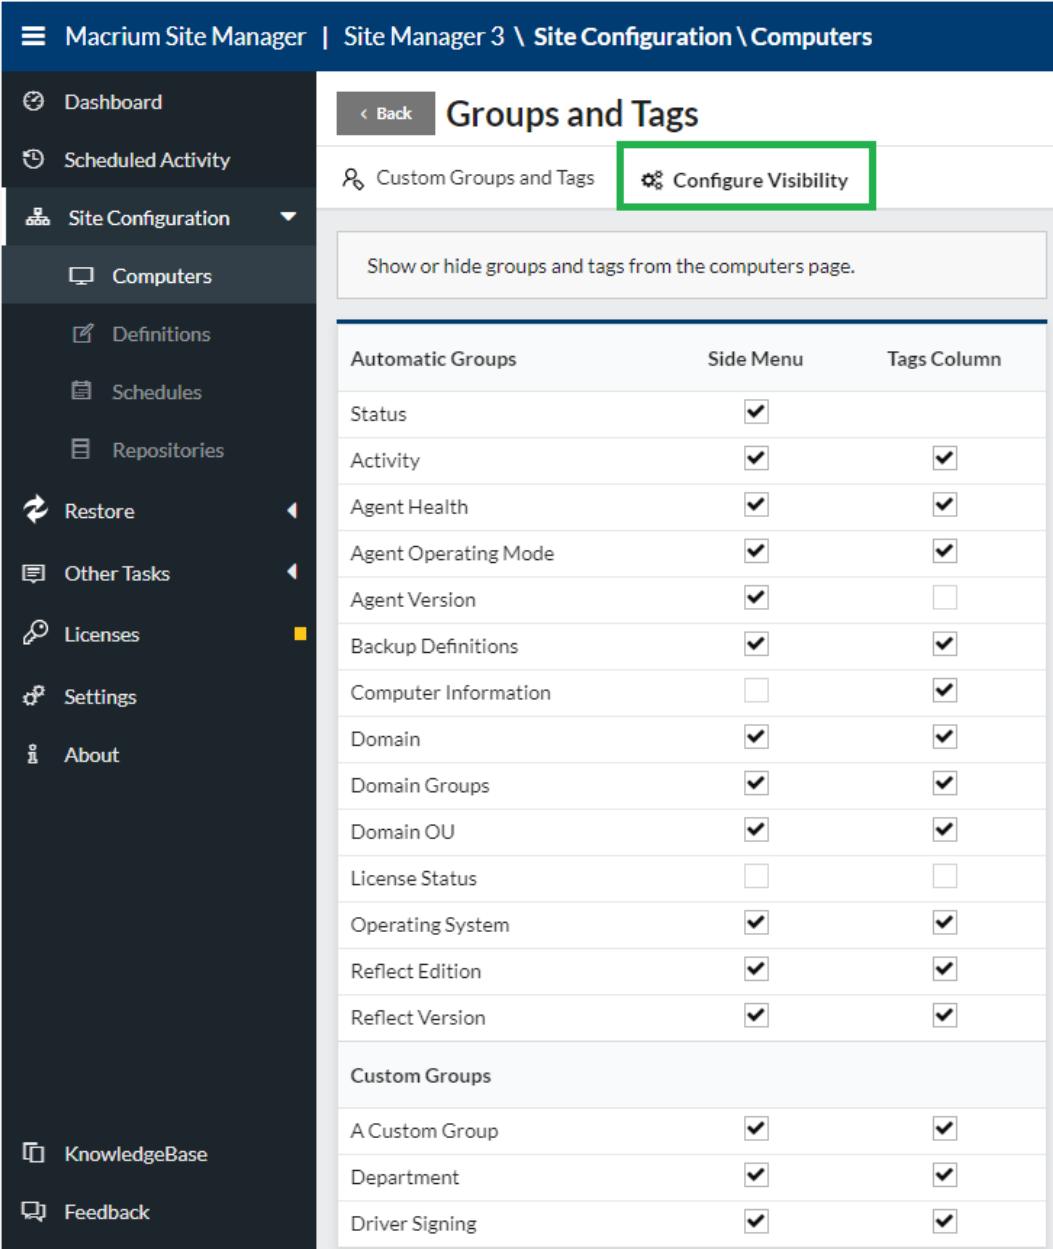

## Groups Visibility

To configure the visibility of the groups on the computers page, click on the "Configure Visibility" tab.

It will show a table with all the *Automatic Groups* and all the *Custom Groups*.

The "Status" group is the only exception: it's always hidden in the Tags Column.

# Macrium Site Manager User Guide

The screenshot shows the 'Groups and Tags' configuration page in Macrium Site Manager. The left sidebar shows the navigation menu with 'Computers' selected. The main content area is titled 'Groups and Tags' and includes a 'Configure Visibility' button, which is highlighted with a green box. Below this is a text box stating 'Show or hide groups and tags from the computers page.' The main table lists groups under 'Automatic Groups' and 'Custom Groups', with checkboxes for 'Side Menu' and 'Tags Column' visibility.

Automatic Groups	Side Menu	Tags Column
Status	<input checked="" type="checkbox"/>	
Activity	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Agent Health	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Agent Operating Mode	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Agent Version	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Backup Definitions	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Computer Information	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Domain	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Domain Groups	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Domain OU	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
License Status	<input type="checkbox"/>	<input type="checkbox"/>
Operating System	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Reflect Edition	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Reflect Version	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Custom Groups		
A Custom Group	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Department	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Driver Signing	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

The groups can be hidden/visible on different places: Side Menu and Tags Column.

## Side Menu

By default, the group will be visible in the side menu on the computers page.

# Macrium Site Manager User Guide

Automatic Groups	Side Menu	Tags Column
Status	<input checked="" type="checkbox"/>	

Configure

All Computers 53

Status

- Connected 53
- Initializing 0
- Disconnected 0
- Reboot Required 1

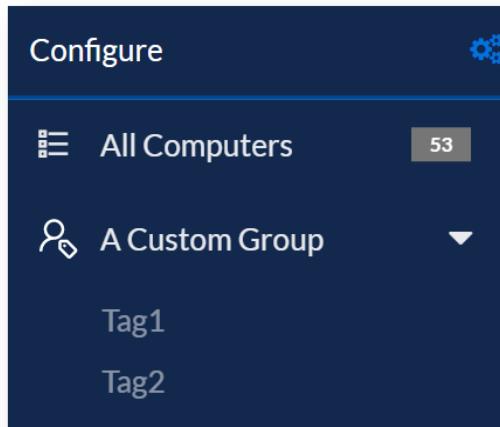

A Custom Group

## Setup - Backup Definitions

A **Backup Definition** contains the data needed to perform a backup on a set of computers. Each definition contains settings for the following information:

- A list of computers which should be backed up.
- A set of rules describing which partitions, disks or files to backup on each computer
- A set of options and settings controlling how the backup files should be created and stored.

**Backup Definitions** contain all the information on *how* and *what* to backup. A Backup Definition can be run manually to perform a single backup of each computer or used to schedule regular backups into a **Repository**

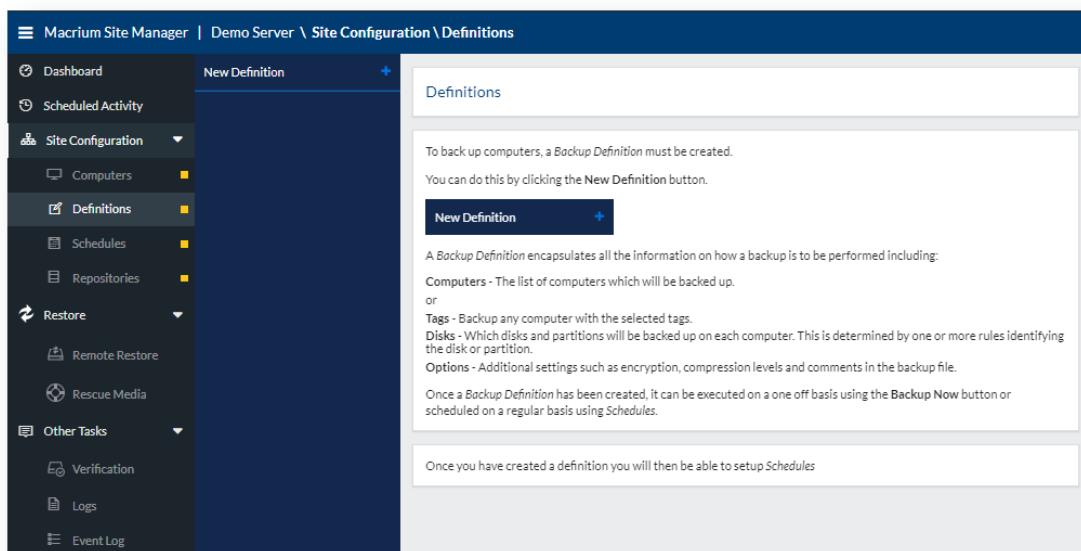

- Creating a Backup Definition
  - Step 1 - Definition Type
  - Step 2 - Computers Selection
  - Step 3 - Disk Image - Disk Selection Rules
  - Step 3 - File and Folder - File and Folder Selection
  - Step 4 - Options
- Backup Definition Operations

# Macrium Site Manager User Guide

- Deleting a Backup Definition
- Copying a Backup Definition
- Editing a Backup Definition
- Running a Backup Definition Manually
- Running Backups Automatically on a Schedule

## Creating a Backup Definition

The '**Backup Definition**' section option in Site Manager contains the list of existing Backup Definitions. If there are no Backup Definitions created, a quick help page is shown instead:

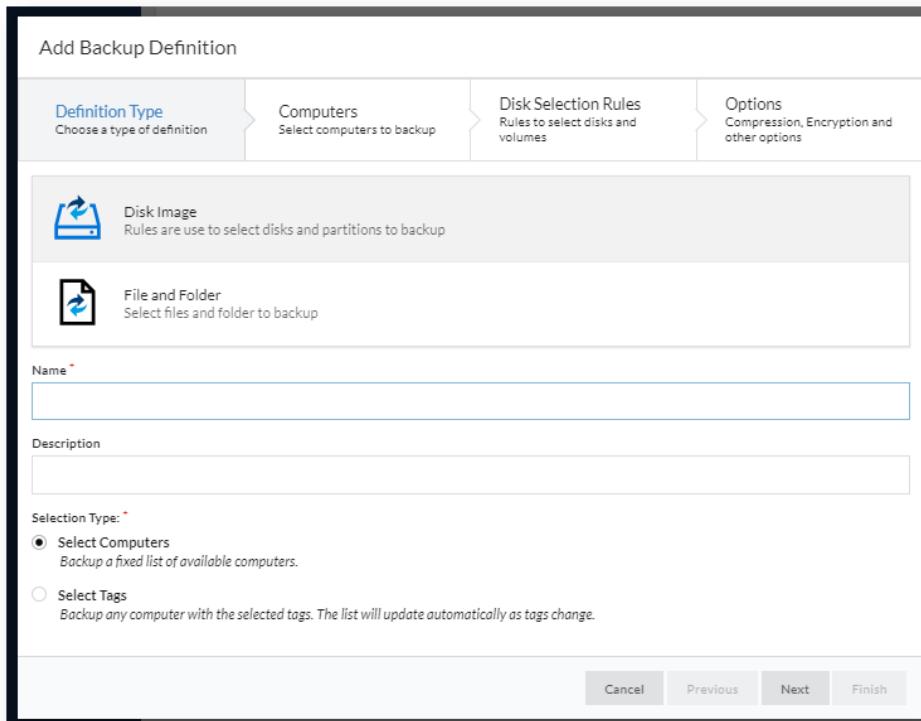

The screenshot shows the Macrium Site Manager interface. The left sidebar has a dark theme with white text. It includes sections for Dashboard, Scheduled Activity, Site Configuration (with 'Definitions' selected), Schedules, Repositories, Restore (with Remote Restore and Rescue Media), and Other Tasks (with Verification, Logs, and Event Log). The main content area has a light gray background. At the top, it says 'Definitions'. Below that, it says 'To back up computers, a Backup Definition must be created. You can do this by clicking the New Definition button.' A large blue button labeled 'New Definition' is centered. To the right of the button, it says 'A Backup Definition encapsulates all the information on how a backup is to be performed including: Computers - The list of computers which will be backed up. or Tags - Backup any computer with the selected tags. Disks - Which disks and partitions will be backed up on each computer. This is determined by one or more rules identifying the disk or partition. Options - Additional settings such as encryption, compression levels and comments in the backup file. Once a Backup Definition has been created, it can be executed on a one off basis using the Backup Now button or scheduled on a regular basis using Schedules.' At the bottom of the content area, it says 'Once you have created a definition you will then be able to setup Schedules'.

Clicking on '**New Definition**' will open the Backup Definition wizard.

The steps of the wizard are:

# Macrium Site Manager User Guide

## Step 1 - Definition Type

The first step is to select the type of Backup Definition. The types available are:

Definition Type	Description
Disk Image	This definition type creates image backups of full disks or partitions. It is configured by setting a set of rules which control which partitions or disks are included. This is the most efficient backup type for large amounts of data and provided the correct partitions have been backed up, these image files can be used to restore a fully bootable Windows OS.
File and Folder	File and Folder backups only back up files on specific paths from a disk. This is a faster, more convenient backup type when only critical data from a disk needs to be backed up. e.g. c:\accounts\*.

Once the backup type has been selected, a name for the Backup Definition must be entered. This is for display purposes only. An optional description may also be entered.

The **Selection Type** controls how computers are selected for backup in the next step of the wizard. The available options are:

# Macrium Site Manager User Guide

Selection Type	Description
Select Computers	Select computers from a list. Computers will remain part of this backup definition until removed manually
Select Tags	Select a set of tags to associate with this backup group. Any changes to the membership of these tags will change the backup definition automatically

## Step 2 - Computers Selection

This stage lists available computers to be part of the Backup Definition. If **Select Computers** was chosen in the previous step, a computers list will be displayed:

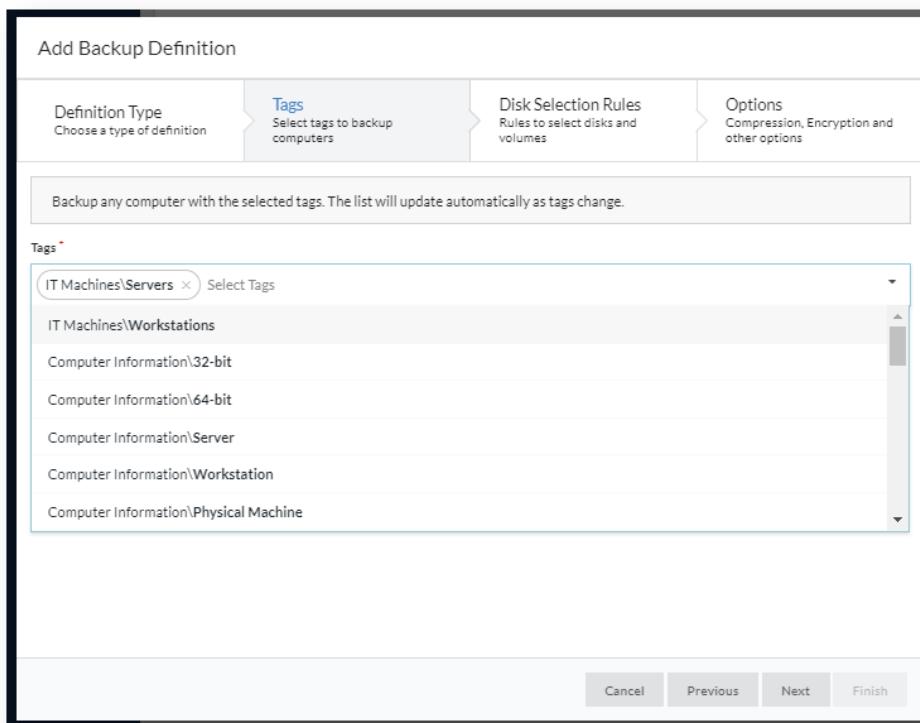

Columns can be filtered and sorted in the computer list to aid in finding the right computers. If there are large numbers of computers they will be split into multiple pages.

The screenshot shows the 'Add Backup Definition' dialog with the 'Computers' tab selected. The list view displays 11 items, all of which are marked as 'Disconnected'. The columns are 'Computer', 'Description', and 'Status'. The 'Description' column shows a placeholder text: 'This is a custom description for Alex's De...'. The 'Status' column shows a yellow signal icon followed by the word 'Disconnected'. At the bottom, there are navigation buttons for 'Previous' and 'Next', and a status bar indicating '1 - 11 of 11 items'.

If **Select Tags** was chosen in the previous step, the tags selection will be displayed:

# Macrium Site Manager User Guide

This interface allows multiple tags to be selected. Not all tag groups are valid for use as a Backup Definition tags. Only the following groups can be used:

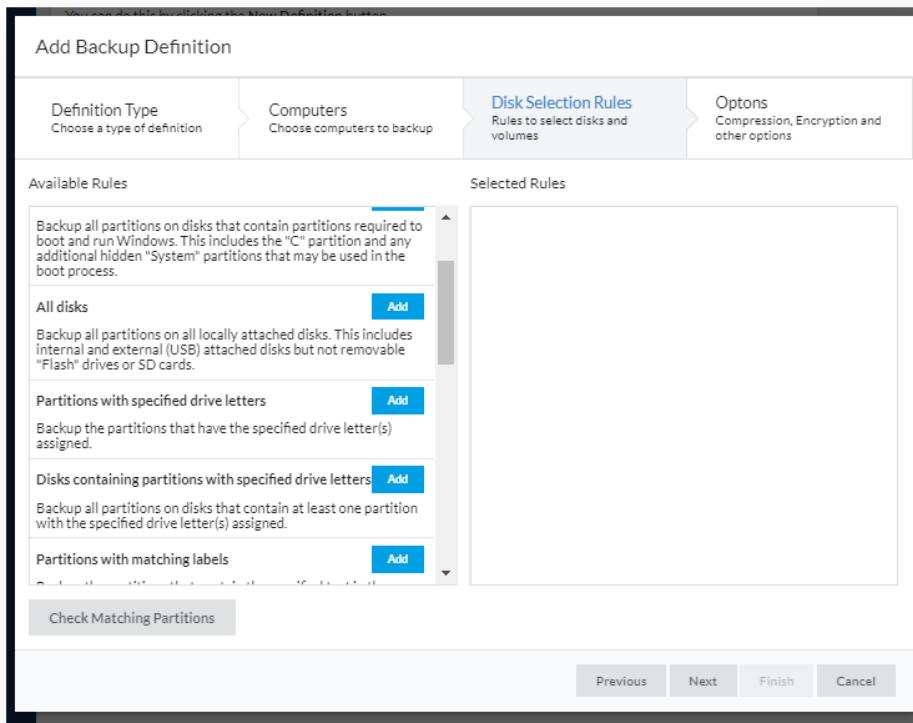

- Any user created tag
- Computer Information (Architecture, virtual machine status)
- Windows Version
- Domain
- Domain OU (Organizational Unit)
- Domain Groups (Security and Distribution Groups)

Once the computers or tags required have been selected, press **Next** to advance to the next step. This step will vary depending on the definition type selected in stage 1.

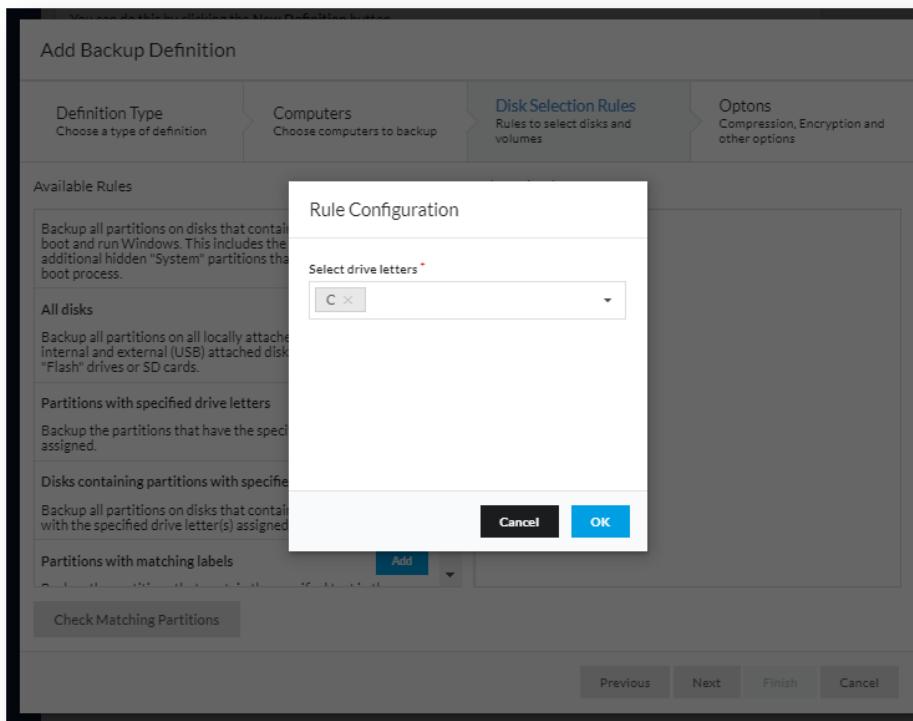

## Step 3 - Disk Image - Disk Selection Rules

For **Disk Image** backups, the next stage is to select rules which control which partitions and disks will be imaged as part of the backup.

# Macrium Site Manager User Guide

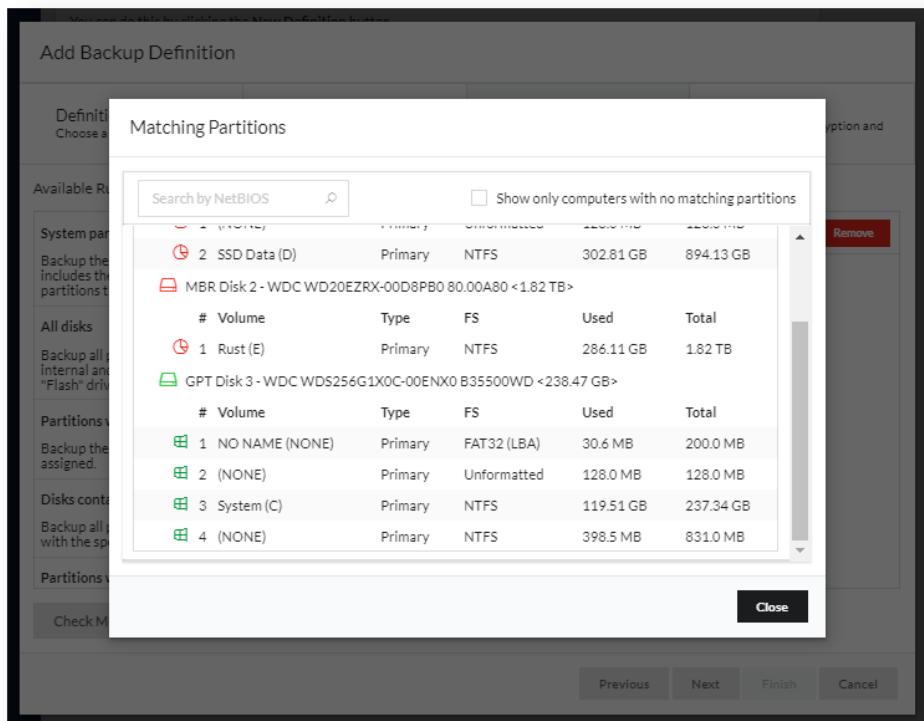

A set of rules are available on the left hand side of the screen. To use a rule, press the **Add** button on the rule to move it to the right hand side of the list. Some rules have additional configuration such as a volume label or drive letter to match. In this case, a dialog box will pop up when adding the rule as seen below:

# Macrium Site Manager User Guide

Once rules have been added, they are listed in the right hand pane of the interface. If a rule has additional configuration, it can be reconfigured by pressing the pencil icon on the right of the rule name. A rule may be removed by clicking it to select and clicking the **Remove** button.

To assist in configuration, pressing the **Check Matching Partitions** button will show the partitions on the computers in the definition which match the rule:

The disk matching information can be filtered by computer or to show only computers with no matches. This can help identify any gaps in rules.

For simple operation, there is an '**All Disks**' rule which will match everything on all computers.

## Exclude Rules

There are exclusion rules as well as inclusion rules - the exclusion rules make it easier to backup all data except those meeting the criteria. For example, if there are multiple computers in the definition, each with a number of partitions and drive letters which need to be backed up without backing up the Windows partitions, this can be achieved using an exclusion rule. Exclusion rules work in the following way:

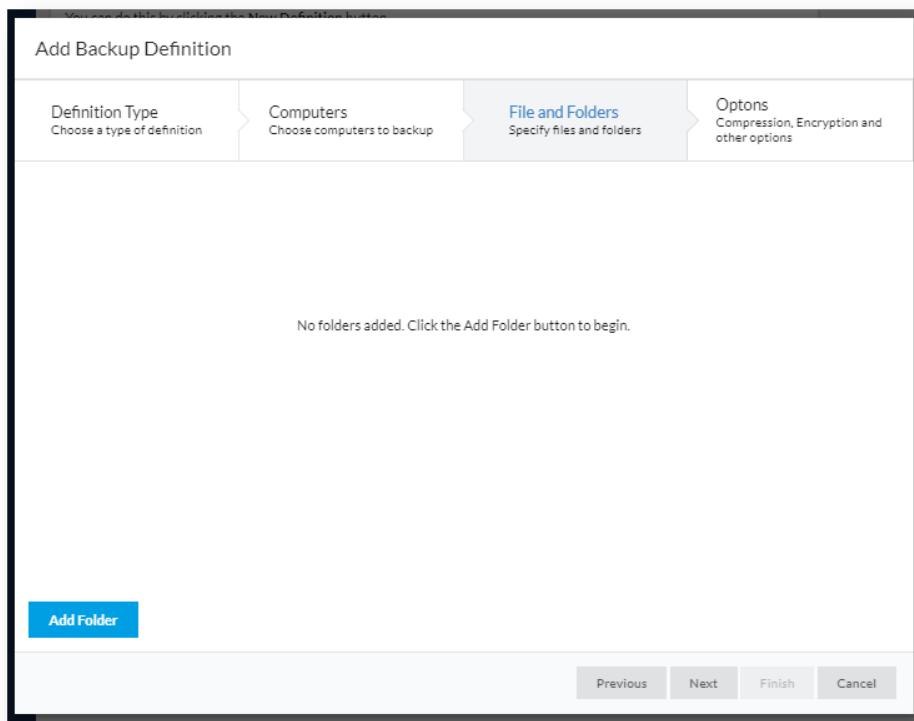

- Exclude rules override include rules - a definition with an include rule for system drives plus an exclude rule for the C: partition will backup system partitions except for the C: partition.
- If there are only exclude rules, all partitions are included except for those specified by the exclude rule - a definition with just an exclude rule for C: and D: partitions will backup all other partitions.

# Macrium Site Manager User Guide

Once rules are configured, press next to move to the next step.

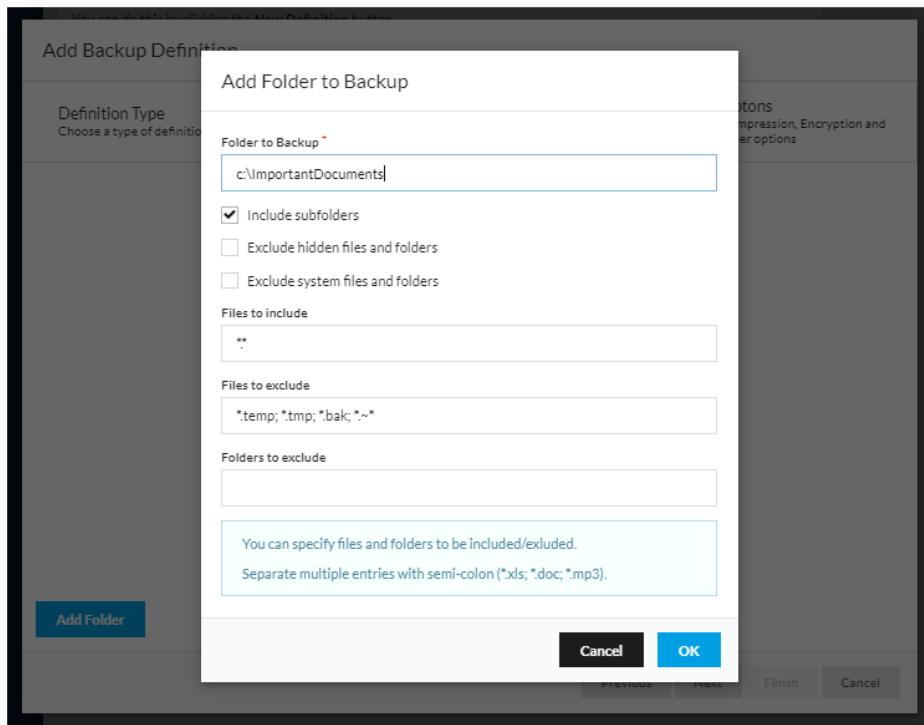

## Step 3 - File and Folder - File and Folder Selection

For **File and Folder** backups, the next stage is to select the folder rules which will be used to identify the files to backup.

At least one folder must be added, using the **Add Folder** button.

# Macrium Site Manager User Guide

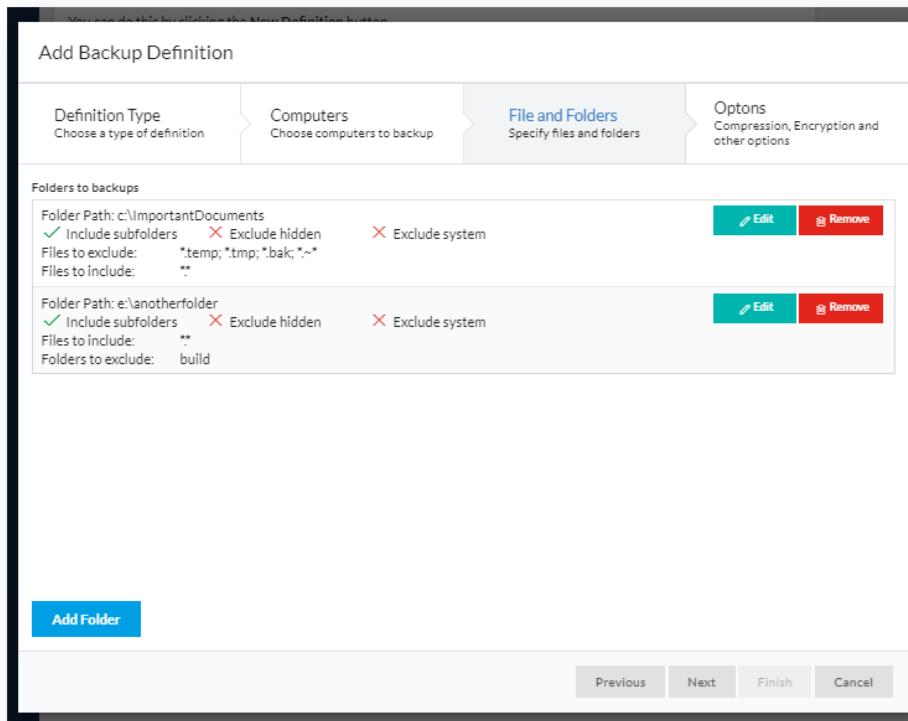

The Add Folder dialog has the following options:

Option	Description
Folder to Backup	The folder path on the Agent computer which will be included in the backup.
Include subfolders	If checked, this option will cause any matching files in subfolders of the target folder to be included in the backup
Exclude hidden files and folders	If checked, any files or folders with the 'hidden' file system attribute will be ignored
Exclude system files and folders	If checked, any files or folders with the 'system' file system attribute will be ignored
Files to include	A file mask for names of files to include within the selected folder/subfolder. e.g. <b>*.docx</b> will include only document files
Files to exclude	As <b>files to include</b> , but these files will be excluded. Takes precedence over the include list
Folders to exclude	As <b>files to exclude</b> , except it is used for subfolder names. Only relevant when <b>Include subfolders</b> is used

# Macrium Site Manager User Guide

Multiple rules can be added to one definition - files matching any rule will be backed up. Rules can be removed and edited using appropriate buttons:

Once rules are configured, press next to move to the next step.

# Macrium Site Manager User Guide

## Step 4 - Options

Add Backup Definition

Definition Type Choose a type of definition	Computers Select computers to backup	Disk Selection Rules Rules to select disks and volumes	Options Compression, Encryption and other options
<p>Compression</p> <p><input type="radio"/> None</p> <p><input checked="" type="radio"/> Medium</p> <p><input type="radio"/> High</p> <p>Higher compression levels may result in smaller backups, but increase the time each backup takes. The Medium level is recommended</p>	<p>Encryption</p> <p><input checked="" type="radio"/> None</p> <p><input type="radio"/> 128-Bit AES</p> <p><input type="radio"/> 192-Bit AES</p> <p><input type="radio"/> 256-Bit AES</p>	<p>Set Password</p>	<p>CPU Priority</p> <p>Above Normal</p> <p>Bandwidth Rate Limit</p> <p><input type="checkbox"/> Enable</p> <p>100</p> <p>Range: 1-20000 MBit/s</p>
<p>Verification</p> <p><input type="checkbox"/> Automatically verify the Image file directly after creation</p>			
<p>Comment</p> <p>Backup comments are saved as part of the backup file. Using comments may help when reviewing backups in the Repository view or using Macrium Reflect</p>			
<p>Cancel Previous Next <b>Finish</b></p>			

In step 3, options for how the backup files are created are set.

Backup Option	Description
Compression	The level of compression to use in any backup files created when using this Backup Definition. The default level is ' <b>Medium</b> '.
Encryption	The type of encryption to use on any backup files created from this Backup Definition. If AES encryption is used, a password must be entered using the ' <b>Set Password</b> ' button.
Verification	If this option is selected, backup files will be reread and verified immediately after creation.
Comment	If a comment is entered here it will be saved as part of any backup files created and be visible to any restore tools.
CPU Priority	The CPU priority to run the backup process as. Lower priorities may result in the backup taking longer if there is contention for CPU resources. The default priority is <b>High</b>

# Macrium Site Manager User Guide

Backup Option	Description
Bandwidth Rate Limit	<p>If enabled, a rate limit can be set for writing to the repository. This will limit the write rate to a specified number of MBit (megabits) per second. This can be used to help manage bandwidth when performing large numbers of backups.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"><p><b>i</b> In the backup progress, a higher transfer rate than the rate limit may be displayed. This is because the transfer limit counts the amount of data read from the source disk and saved into the backup file without including compression.</p><p>After backup is completed, the read and write rate are shown in the backup log.</p></div>

Once the options are set appropriately, press finish to complete the wizard and save the Backup Definition. If there are any errors or issues with saving the Backup Definition, the wizard will not close and an error message will be displayed. If appropriate any affected fields will be highlighted in red.

## Backup Definition Operations

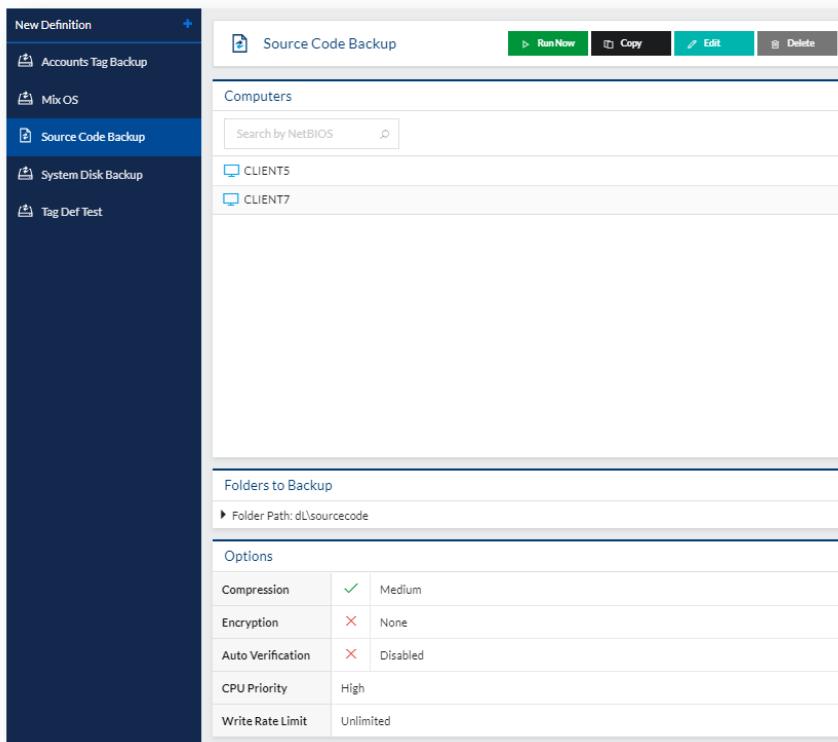

Once Backup Definitions have been created, they are shown in a list as below:

The screenshot shows the 'Backup Definition' list interface. On the left is a sidebar with a tree view of backup definitions: 'Accounts Tag Backup' (selected), 'Mix OS', 'Source Code Backup', 'System Disk Backup', and 'Tag Def Test'. The main area shows the details for 'Accounts Tag Backup':

- Tags:** Accounts
- Computers:** CLIENT26, CLIENT27, CLIENT28, CLIENT29
- Disk Selection Rules:** System partitions
- Options:**

Compression	✓	Medium
Encryption	✗	None
Auto Verification	✗	Disabled
CPU Priority	High	
Write Rate Limit	Unlimited	

# Macrium Site Manager User Guide

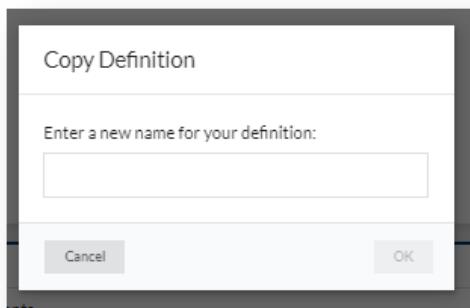

The selected Backup Definition can be changed by clicking on the list of names in the left-hand column. Once a Backup Definition has been selected, the configuration of that Definition is shown. Several operations can be performed on this Definition.

## Deleting a Backup Definition

Clicking the '**Delete**' button to the right of the definition name will delete the selected Backup Definition.

## Copying a Backup Definition

Clicking the '**Copy**' button to the right of the definition name will copy the selected Backup Definition to a new Definition which can then be edited. This is useful for creating multiple Definitions with only minor differences. The new Definition must be given a new name:

# Macrium Site Manager User Guide

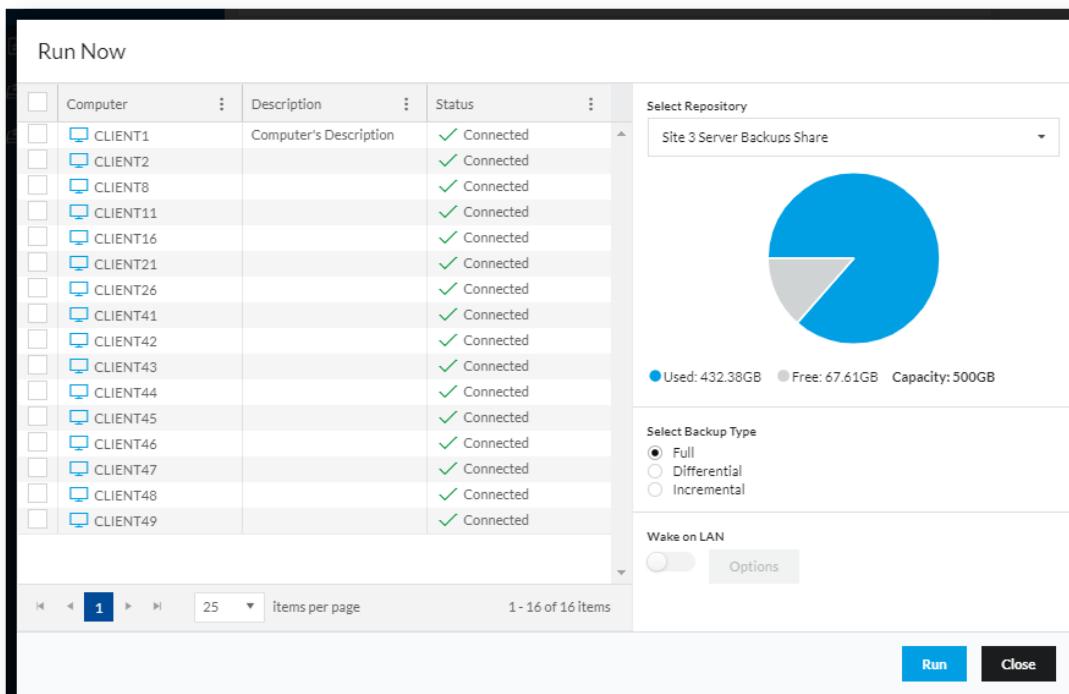

## Editing a Backup Definition

Editing a Backup Definition is possible by clicking any of the **Edit** buttons in the page. Each button will open the Backup Definition wizard at the appropriate wizard step. This is the same process used in creating a Backup Definition except the wizard will be pre-populated with data from the selected Definition. When editing a Backup Definition the '**Finish**' button may be pressed at any stage and not just the final one.

## Running a Backup Definition Manually

To run a Backup Definition on a one-off basis, the **Run Now** button can be clicked. This opens a dialog which allows to to select:

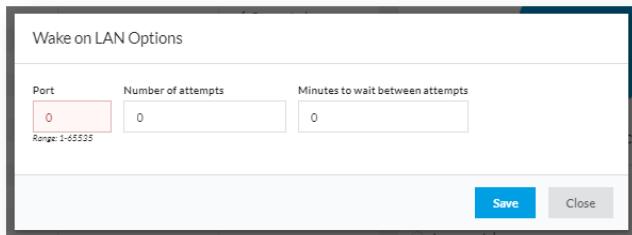

- The computers to backup
- The Repository to backup to
- The type of backup (Full, Differential, Incremental)

If the **Wake on LAN** option is selected, disconnected computers may be selected as well as connected ones. The Site Manager server will attempt to wake any disconnected computers up as part of the the backup process.

The Wake on LAN options allows detailed Wake-on-LAN options to be set:

# Macrium Site Manager User Guide

Selecting **Run** will run the backup with the selected options. Run Now backups can be seen in the forecast in the **Dashboard** page.

## **i** Backup Types

If a Differential or Incremental backup is selected without a corresponding Full backup in the Repository to base the Differential or Incremental backup on, the computer will perform a Full backup instead.

## Running Backups Automatically on a Schedule

To perform automated backups according to a schedule, The Backup Definition can be scheduled to run in a Repository according to a Schedule. More information is available [here](#).

## Setup - Schedules

- Overview
- Default Schedules
- Creating a Schedule
  - Step 1 - Triggers
  - Step 2 - Retention Rules
  - Step 3 - Options
  - Finalizing the Schedule
- Editing and Deleting Schedules
- Copying Schedules

## Overview

A **Schedule** contains information on when backups are to be performed and how long each backup is to be kept. The data in a Schedule includes:

- Triggers which define when backups should be taken and what type of backup (Full, Differential, Incremental)
- Retention rules describing how long or how many backups should be kept before old backups are removed.

# Macrium Site Manager User Guide

- Options for advanced behaviors of how retention rules should be applied

To work with Schedules, visit the Schedules page of the Management Console by clicking the '**Schedules**' link under the '**Setup**' heading. On the initial visit to the Schedules page, or if all Schedules are deleted, the page will show some general help and information on Schedules:

## Default Schedules

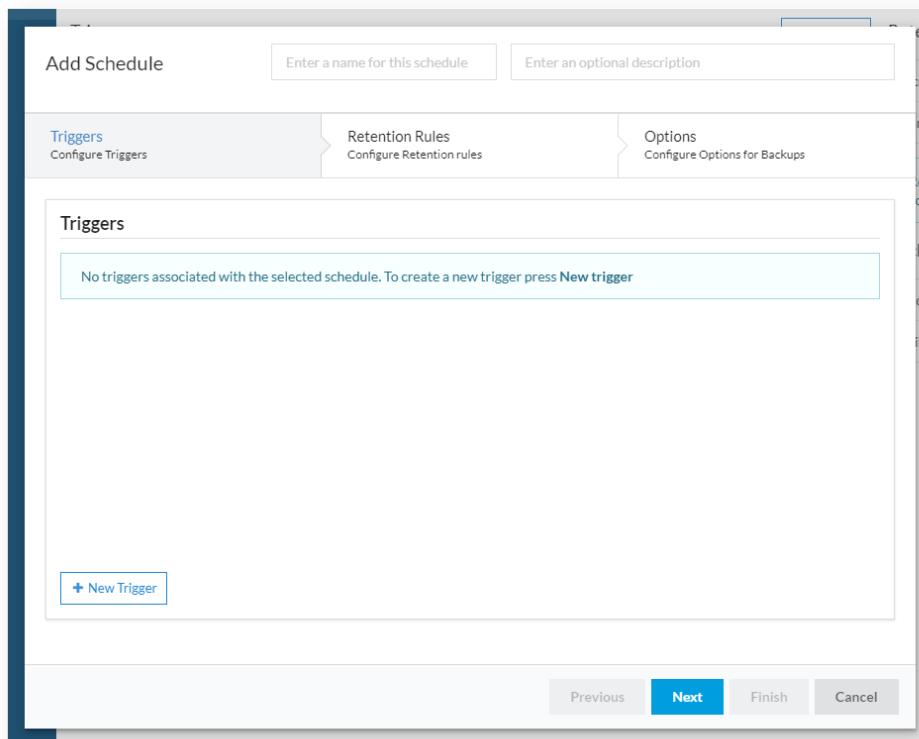

On the initial guidance page for Schedules, there is an option to create a set of default Schedules. These defaults can be edited and modified once created to provide the exact scheduling required. The defaults created are:

- **Grandfather, Father, Son** - Daily Incremental ("Son"), weekly Differential ("Father"), and monthly Full ("Grandfather") backups.
- **Differential Backup Set** - A Full backup is created periodically followed by daily Differential backups.
- **Incremental Backup Set** - A Full backup is created periodically followed by daily Incremental backups.
- **Incrementals Forever** - Incrementals forever optimizes backup space and time by only ever creating a single Full backup.  
After this Incremental backups are created ad infinitum. The Full backup is consolidated with subsequent Incremental backups once the specified number of Incremental backups is reached.  
This is also known as a Synthetic Full backup.
- **Intra-Daily Backup Set** - Monthly Full backups, daily Differential backups and Incremental backups every 15 minutes during working hours. Differentials are retained for 4 weeks., Full images for 6 months.

## Creating a Schedule

To create a new Schedule, click the '**New Schedule**' button in the upper left of the interface. This opens the Schedule creation wizard:

# Macrium Site Manager User Guide

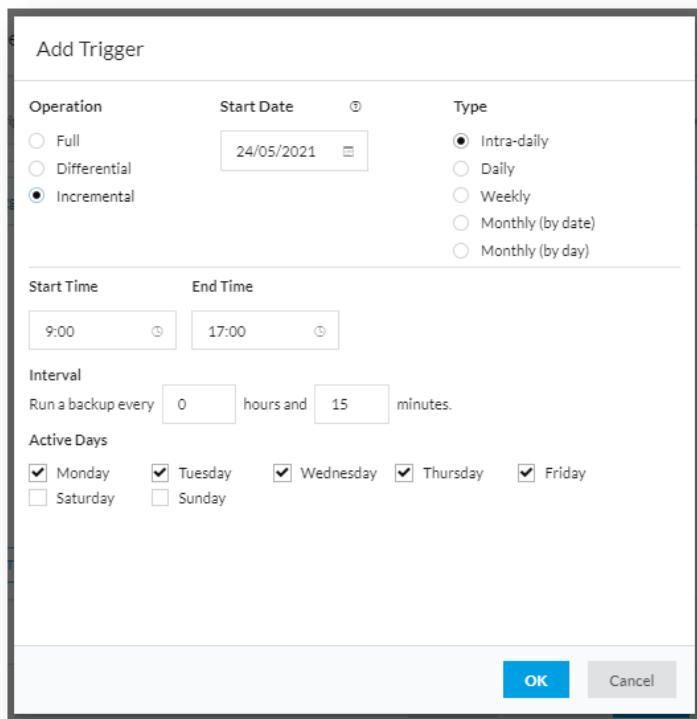

Each Schedule must have a name set in the box at the top. An additional description may be included.

## Step 1 - Triggers

The first stage of the wizard is to define the triggers for when backups are to be run. To create a new trigger, press the '**New Trigger**' button. This opens a dialog box as seen below:

# Macrium Site Manager User Guide

The Add Trigger dialog has a number of options for creating the trigger. These are:

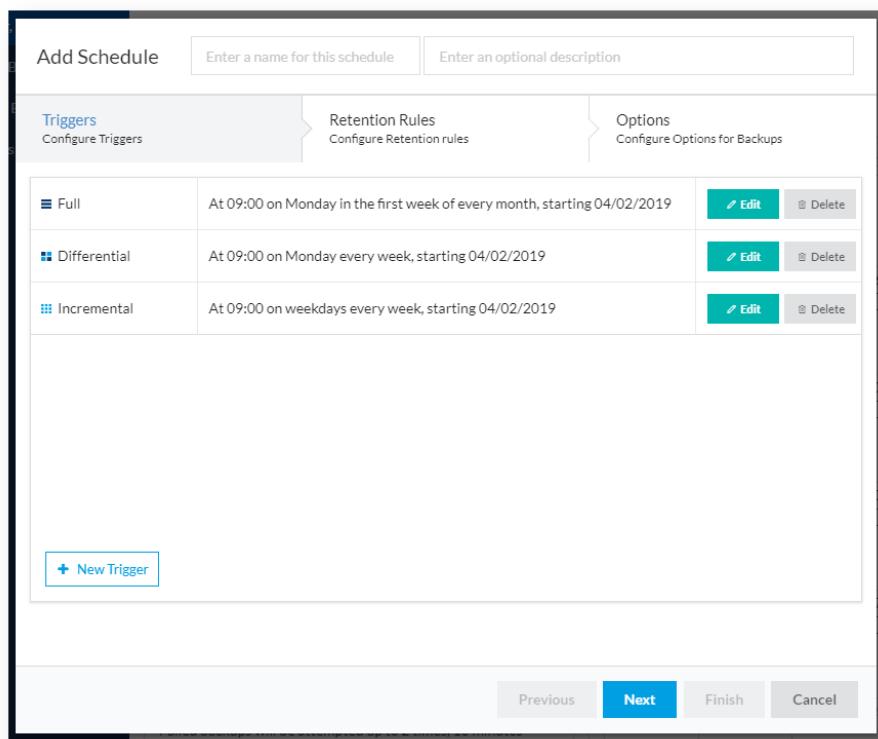

Option	Description
<b>Operation</b>	Which type of backup to perform when this trigger initiates a backup. May be Full, Differential or Incremental.  <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"><p><b>i</b> If a trigger fires for an Incremental or Differential backup, but no Full backup exists in the repository to base the Differential or Incremental backup on, the backup is automatically converted to a Full backup.</p></div>
<b>Start Time</b>	The time of day the backup operation will occur. If a backup is delayed because another backup is running, the backup will run as soon as able.
<b>Start Date</b>	The date when the trigger starts. The trigger will not initiate a backup before this date. This is useful to ensure that complex rules start at the right time. For example, making sure a trigger for an Incremental backup on Tuesdays doesn't occur before a Full backup trigger on Fridays.
<b>Trigger Type</b>	The type of trigger - the options are listed below in the 'Trigger Details' section.

## Macrium Site Manager User Guide

Option	Description
	<p>When triggers occur at the same time, only one backup is taken, with the more thorough backup taking precedence (Full over Differential, Differential over Incremental). For example: given a weekly Full backup trigger which occurs at 10:00 PM and a daily Incremental backup trigger at the same time, the Full backup will take precedence and run. This allows for simpler trigger creation - for example a weekly and daily trigger which overlap rather than two weekly triggers, one for one day and the other for all other days of the week.</p>
Trigger Details	<p>The panel changes depending on the trigger type.</p> <ul style="list-style-type: none"><li>• <b>Intra-Daily</b> - backup every <b>n</b> minutes between the start and stop times. May be restricted to certain days of the week.</li><li>• <b>Daily</b> - Interval (every <b>nth</b> day)</li><li>• <b>Weekly</b> - Interval (every <b>nth</b> week) and Active Days (Monday, Weekends etc)</li><li>• <b>Monthly (by Date)</b> - Active Days (the day number(s) in the month - 1st to 31st) and Active Months (which months of the year the trigger is active during)</li><li>• <b>Monthly (by Day)</b> - Week of the month (which week number, 1st to 4th or last the active days entry applies to), Active Days (the day(s) of the week the trigger will fire on) and Active Months (which months of the year the trigger is active during)</li></ul>

Once the trigger data is correct, press '**OK**' to save the trigger. The trigger will then be displayed in the trigger list:

# Macrium Site Manager User Guide

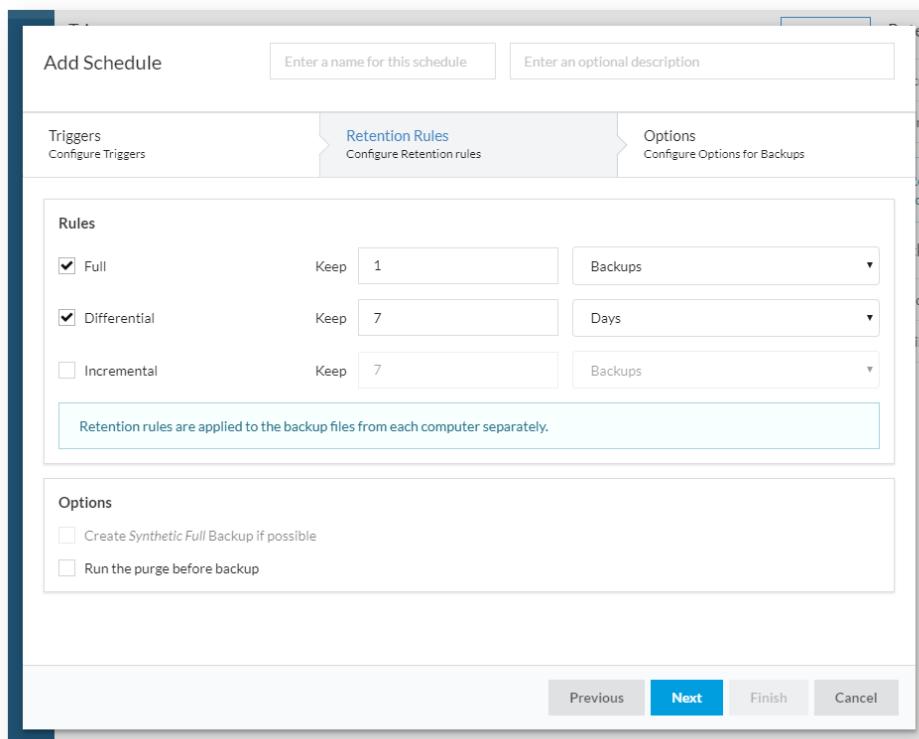

Each trigger listed has an 'Edit' button to re-open the trigger creation dialog to edit the trigger and a 'Delete' button to remove the trigger.

Once triggers have been created, press the 'Next' button to continue to step 2. There must be at least one trigger to proceed.

## Step 2 - Retention Rules

**Retention rules** govern how long backups are kept in the repository before being deleted to conserve space. The retention rules step appears as follows:

# Macrium Site Manager User Guide

The '**Rules**' section contains the retention rules for each backup type. If the checkbox next to each rule is checked, if there are any backups older than the time period or count of backups specified in the dropdown boxes.

If the **Retention Rule** for a given backup type is unchecked, those backups are kept forever unless manually deleted from the repository.

**Retention rules** are applied on a per-computer basis. If a retention rule is configured to keep 10 Full backups, the rule will keep 10 Full backups per computer in the backup plan.

The '**Options**' section contains options for additional and fine control over the way retention rules are applied. Options available are:

Option	Description
<b>Create a Synthetic Full Backup if possible</b>	If this option is checked, instead of deleting Incremental backup files once they have reached the limit of retention, they are merged into the Full backup they are based on, creating a new Full backup containing all the data up to the merge point

# Macrium Site Manager User Guide

Option	Description
	<p>This option only applies to backup plans such as 'Incrementals Forever' where a single Full backup is followed by frequent Incremental backups. The retention rule for Incremental backups must be enabled and set to 'Backups' mode for this option to become available.</p>
<b>Run the purge before backup</b>	<p>This option applies retention rules and deletes any files according to retention rules before the backup starts.</p> <p><b>Info:</b> This keeps repository space usage lower but may result in fewer retained backups when new backups fail</p>

## Step 3 - Options

**Options** control how backups are scheduled and what actions are taken on failure. The interface appears as below:

The screenshot shows the 'Add Schedule' interface in Macrium Site Manager. The 'Options' tab is selected. The 'Offline Computers' section contains the following settings:

- Defer backups until computer is online (selected)
- Send Wake On LAN message before backup
- Fail backups for offline computers
- UDP port: 9
- Attempts: 3
- Wait between attempts: 1 minutes

The 'Failed backups' section contains the following settings:

- Retry backups which fail
- Intra-daily Stealth Mode (selected)
- Disable Agent Notifications (selected)
- Backups should be attempted up to 2 times
- Allow 10 minutes between attempts of failed backups

At the bottom of the interface are buttons for Cancel, Previous, Next, and Finish.

The available options are:

# Macrium Site Manager User Guide

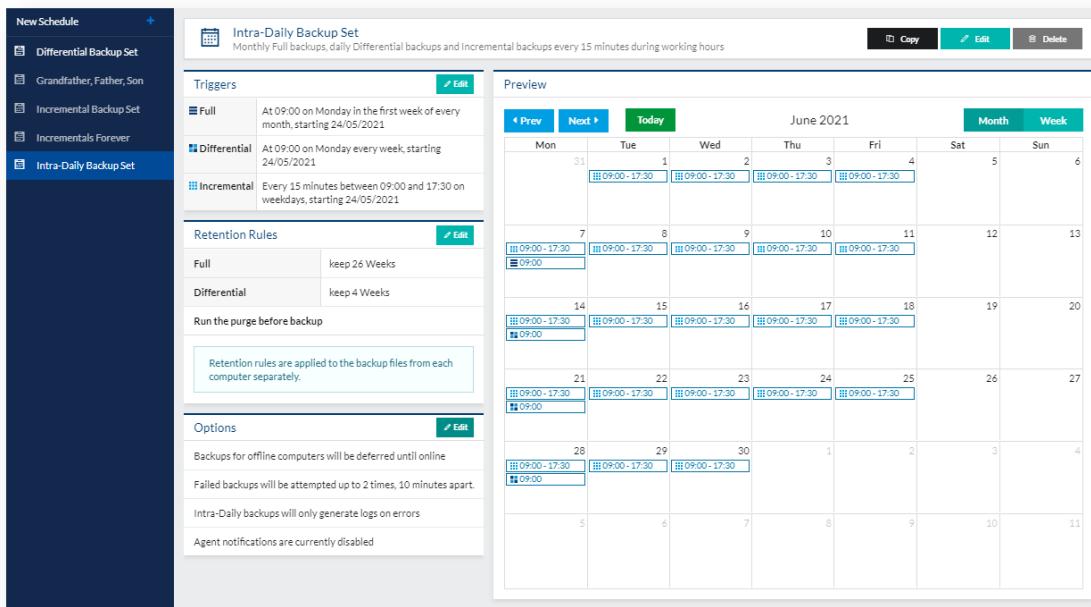

Option	Description
<b>Defer backups until computer is online</b>	If this option is selected, scheduled backups cannot be performed because a computer is offline will be performed when the computer comes back online. If the option is unchecked, scheduled backups will fail if the computer is offline
<b>Send Wake On LAN message before backup</b>	If this option is selected, Site Manager will attempt to use Wake On LAN to wake offline computers before starting a backup. If Wake On LAN attempts fail, it will behave as the "Fail backups for offline computers" option  Additionally, UDP port, number of wake attempts and time between attempts can be set.
<b>Fail backups for offline computers</b>	If this option is selected, backups will be failed if the computer is offline and the computer will not perform a backup until the next trigger time or next retry time as set below.
<b>Retry backups which fail</b>	If a backup attempt fails, it can be retried up to the number of times specified here
<b>Allow X minutes between attempts of failed backups</b>	The time between each attempt which Site Manager will wait. May be set to between 2 and 120 minutes. Backups of other computers may occur between the retries.
<b>Intra-daily Stealth Mode</b>	When Intra-daily stealth mode is enabled, backups that are triggered by Intra-daily triggers will only create backup logs if there is an error or if new files/folders have been found (For File and Folder Backups). Instead of logs, the logs view will show a daily summary for each computer backed up
<b>Disable Agent Notifications</b>	When enabled, pop-ups are suppressed on the Agent computer, so that the backup is completely silent to a user of that computer. If the user has manually launched the monitor app on the Agent computer, they will receive notifications until log off.

## Finalizing the Schedule

Once the options have been set appropriately, press '**Finish**' to save the Schedule.

Once the Schedule is saved, the Management Console will display the Schedule list with the newly created Schedule selected:

# Macrium Site Manager User Guide

The screenshot shows the 'New Schedule' interface for Macrium Site Manager. On the left, a sidebar lists backup sets: Differential Backup Set, Grandfather, Father, Son, Incremental Backup Set, Increments Forever, and Intra-Daily Backup Set (which is selected). The main area is titled 'Intra-Daily Backup Set' and describes it as 'Monthly Full backups, daily Differential backups and Incremental backups every 15 minutes during working hours'. It includes sections for 'Triggers', 'Retention Rules', and 'Options'. The 'Triggers' section shows three types: Full (At 09:00 on Monday in the first week of every month, starting 24/05/2021), Differential (At 09:00 on Monday every week, starting 24/05/2021), and Incremental (Every 15 minutes between 09:00 and 17:30 on weekdays, starting 24/05/2021). The 'Retention Rules' section specifies 'Full' to 'keep 26 Weeks' and 'Differential' to 'keep 4 Weeks'. The 'Options' section notes that backups for offline computers will be deferred until online, failed backups will be attempted up to 2 times 10 minutes apart, intra-daily backups will only generate logs on errors, and agent notifications are currently disabled. On the right, a 'Preview' section shows a monthly calendar for June 2021 with scheduled backup times (09:00-17:30) marked for each day.

## Editing and Deleting Schedules

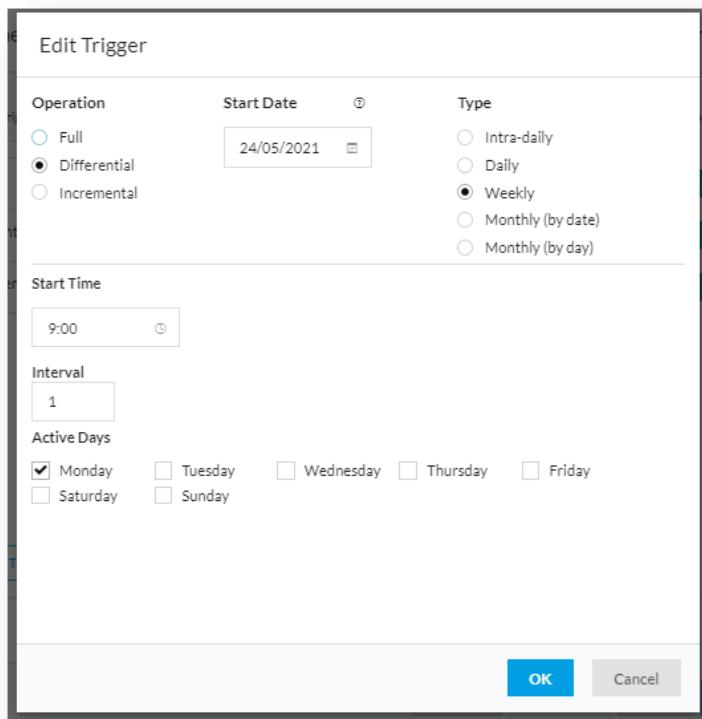

Once a Schedule has been created, it can be edited by selecting the 'Edit' button in the top right. This will reopen the Schedule wizard and allow the Schedule to be edited. In addition, the retention rules panel has an edit button which can be pressed to open the Schedule for editing and jump to the retention rules section.

### *ⓘ* Deleting Schedules

Deleting a Schedule may fail if that Schedule is being used to schedule backups in a Repository. In this case, deleting the Schedule will require those scheduled backups to be removed or changed to use a different Schedule first.

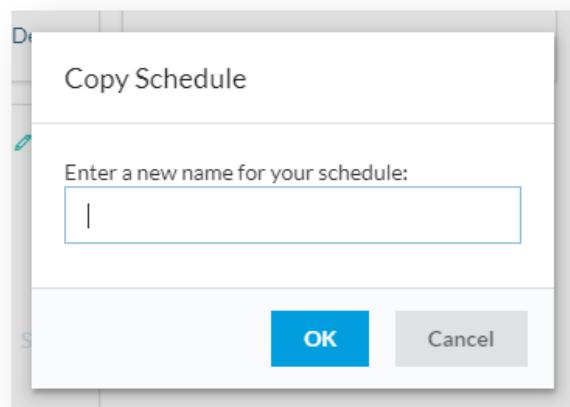

The triggers may be edited directly by using the pencil icon on each trigger's display in the view. They can also be deleted with the delete icon and new triggers can be created with the 'New Trigger' button. Creating and editing triggers this way launches the dialog box for triggers and not the whole Schedule wizard:

# Macrium Site Manager User Guide

## Copying Schedules

An existing Schedule can be copied to a new Schedule to make creating Schedules which are almost the same simpler. Pressing the 'Copy' button on the top right of the interface will prompt for a name for the copy of the selected Schedule.

Selecting OK will copy the Schedule.

## Setup - Repositories

# Macrium Site Manager User Guide

- Introduction
- Adding a Repository
  - Network Share Repository
  - Amazon AWS Storage Gateway
  - Azure Storage Account
  - Local Repository
  - Adding a new Repository - Final Steps
- Viewing Repository Information

## Introduction

**Repositories** are required in order to use the central backup scheduling and queuing facilities in Site Manager. Once a repository has been set up, a Backup Definition can be configured to back up to the Repository according to a Schedule.

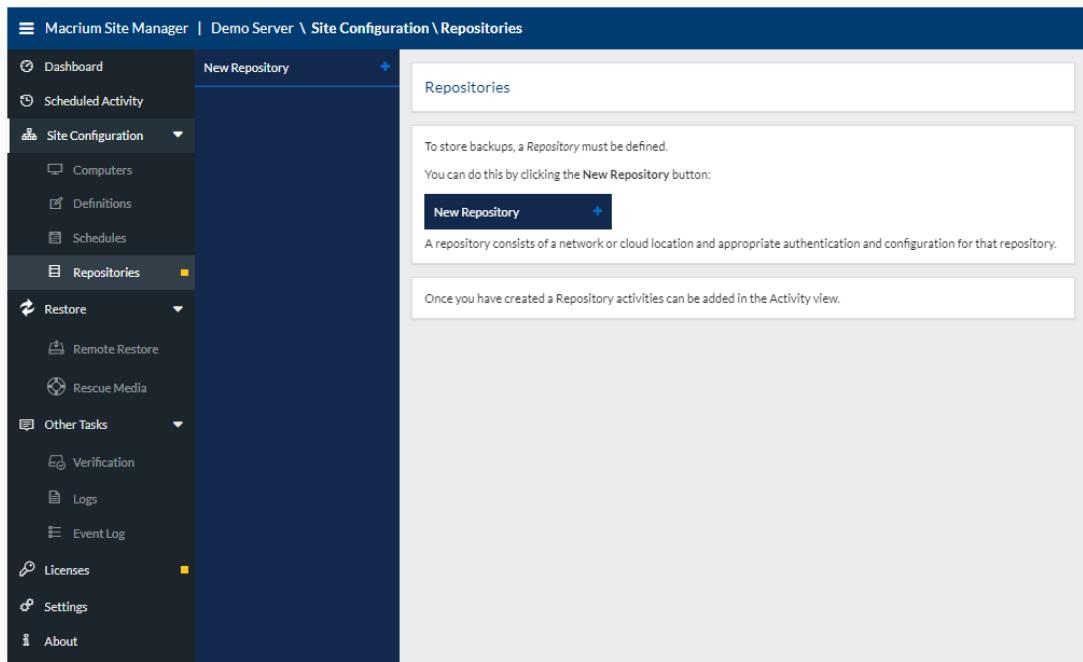

A repository is a storage location with a standardized folder layout and some tracking information. Each repository contains backup information such as, storage location, network access information, credentials required to access the resource and other basic storage management.

The following types of Repository backend are available:

- **Network Share** - Any Windows or SMB network share may be used as Repository storage
- **Amazon AWS Storage Gateway** - if an AWS Storage Gateway is available, it can be used as a Repository backend.
- **Azure Storage Account** - if Azure storage is exposed as an SMB share in Azure, it can be used as a Repository directly.
- **Local Repository** - Storage which is directly attached to a managed computer can be used as a Repository

# Macrium Site Manager User Guide

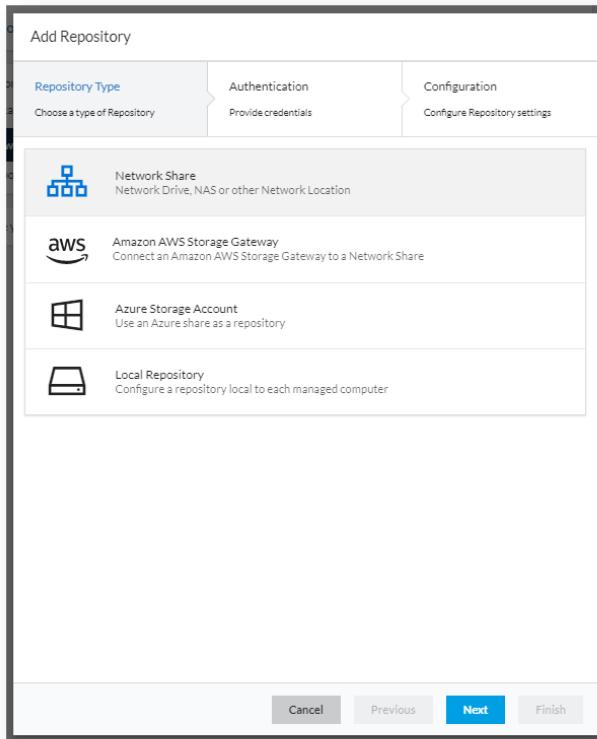

## Adding a Repository

**Repositories** are managed by selecting the '**Repositories**' link from the main interface under the '**Setup**' main category. Initially the **Repository** interface will have no saved repositories and show some quick help notes.

To create a new Repository, click the '**New Repository**' link in the upper left, as seen in the image above. This will display the 'Add Repository' wizard shown below:

# Macrium Site Manager User Guide

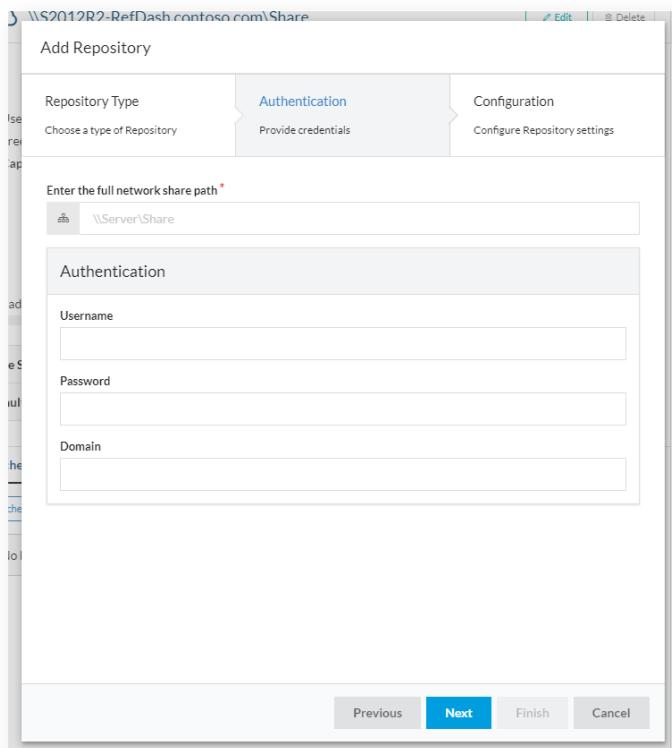

The initial repository wizard page allows the type of Repository to be selected. Once the appropriate type has been selected, click '**Next**' to move to the next step.

Depending on the Repository type chosen, the next stage will be different. See the appropriate section for details.

## Network Share Repository

For a **Network Share** type repository, the next stage of the wizard is shown below:

# Macrium Site Manager User Guide

This stage of the wizard allows you to configure the network path and access credentials for the Repository. The available options are as follows:

Option	Description
<b>Path</b>	<p>This option will let you select the path to the network share in Windows UNC format.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"><p><span style="color: #0070C0; font-size: 1.5em;">i</span> Example: \\SERVERNAME\\Share</p></div>
<b>Authentication</b>	<p>Here you will input the authentication credentials that are needed to access the repository.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"><p><span style="color: #0070C0; font-size: 1.5em;">i</span> The user requires to have <b>Read and Write</b> access to the repository so that the backup may be created and retention rules can be applied. <b>If the field is left blank anonymous access will be used.</b></p><p><span style="color: #FF8C00; font-size: 1.5em;">!</span> When performing a backup, this authentication information is transmitted to Agent computers so that they can directly access the share. To avoid problems at the client end, it is recommended that the Domain part of the authentication is always filled in. If the share is on a computer or NAS which is not joined to a domain, the host name of the computer or NAS should be used instead.</p></div>

# Macrium Site Manager User Guide

Option	Description
	The Site Manager server will resolve IP addresses for the share and send these IP addresses to the Agent when backing up. This allows computers which cannot resolve the SMB server name to an IP address to connect and perform backups

Once this step has been completed, the next step is the final configuration page, described [here](#).

## Amazon AWS Storage Gateway

See [Configuring AWS Storage Gateway](#) for information on configuring an on-premises gateway to the Amazon cloud. Once setup, the next stage is add the AWS Storage Gateway settings. After adding a new repository and selecting Amazon AWS Storage Gateway, the following wizard page is shown:

The screenshot shows the 'Edit Repository' wizard for 'Storage Gateway' settings. The 'Authentication' step is active. It includes fields for 'Access Key ID' and 'Secret Key ID', both containing placeholder text. A 'Region' dropdown is set to 'EU (Ireland)'. A 'Validate' button is at the bottom right. Navigation buttons 'Previous', 'Next', 'Finish', and 'Cancel' are at the bottom.

Once the Access Key ID and Secret Key ID of the Storage Gateway have been entered, press **Validate** to get a list of gateway names and volumes to select.

# Macrium Site Manager User Guide

# Macrium Site Manager User Guide

This stage of the wizard allows you to configure the network path and access credentials for the Repository. The share entered must be mapped to the AWS Storage Gateway volume selected. The available options are as follows:

Option	Description
<b>Path</b>	This option will let you select the path to the network share in Windows UNC format.  <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"><span style="color: #0070C0; font-size: 1.5em; margin-right: 10px;">i</span> Example: \\SERVERNAME\\Share</div>
<b>Authentication</b>	Here you will input the authentication credentials that are needed to access the repository.

Once this step has been completed, the next step is the final configuration page, described [here](#).

## Azure Storage Account

This repository type connects to an Azure storage account which has been configured to be accessible over the SMB protocol.

The screenshot shows the 'Add Repository' wizard with the 'Azure Share Authentication' tab selected. The 'Repository Type' section shows 'Choose a type of Repository' and three tabs: 'Azure Share Authentication' (selected), 'Provide credentials', and 'Configuration'. A note below states: 'Azure file shares are accessed through SMB 3.0 which is only available on Windows 8.1 / Windows Server 2012 or later. Managed computers running earlier Windows versions will not be able to backup to a repository hosted on Azure.' The 'Azure Storage Account Authentication' section contains fields for 'Share path', 'Username', and 'Password'. Below these is a note: 'Enter the net use command generated by Azure to fill the authentication fields automatically.' A link 'See the knowledge base' is provided for more details. At the bottom are 'Previous', 'Next', 'Finish', and 'Cancel' buttons.

Detailing information on configuring Azure to enable share access is available here - [Backup to the cloud with Azure File Shares](#)

### Azure Repository Limitations

# Macrium Site Manager User Guide

Azure shares use the SMB version 3.0 protocol. This requires that the computer accessing the share is running a version of Windows which supports this on both the Site Manager server and each managed computer which backs up to the Repository. Versions of Windows which support SMB 3.0 are:

- Windows 8 or later
- Windows Server 2012 or later

The wizard page has fields for the **share path**, **username** and **password** of the Azure share. These can be filled in directly, or the **net use** command generated by the Azure portal can be pasted directly into the box below to extract the share information and automatically fill in the other fields.

Once this step has been completed, the next step is the final configuration page, described [here](#).

## Local Repository

A local repository is a path which is evaluated on each individual managed computer such as a Windows file path.

This allows scenarios where some computers may be backed up to locally attached storage (USB drives, iSCSI, Windows Shares which are not visible to the Site Manager server etc) but still centrally managed.

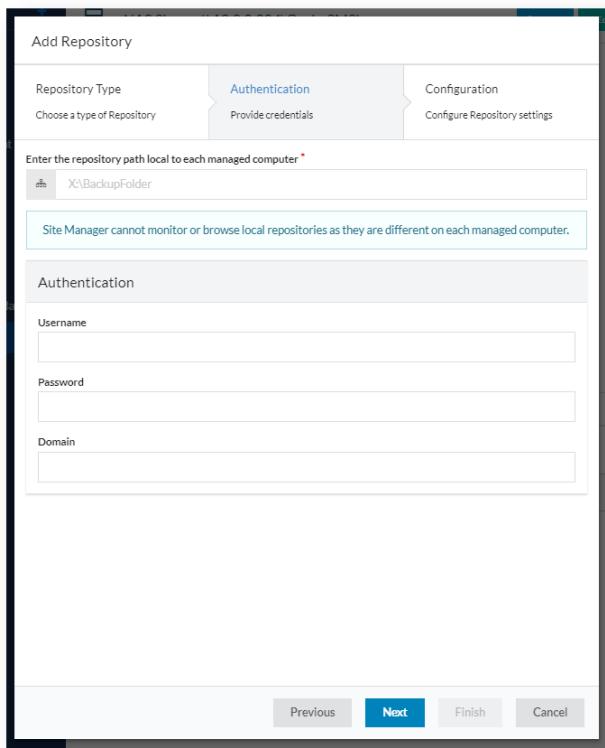

### Local Repository Limitations

Because each computer evaluates the Local Repository path separately, the Site Manager server cannot provide most management features for a Local Repository.

This includes browsing, image verification, free space and status monitoring, Site Manager initiated restore and remote synchronization.

Repository browsing and restore should be done from the managed computer

# Macrium Site Manager User Guide

The Local Repository configuration consists of a path to be evaluated on the managed computer - e.g. X:\ which will backup to the local X: drive on each computer, not the Site Manager server's X: drive.

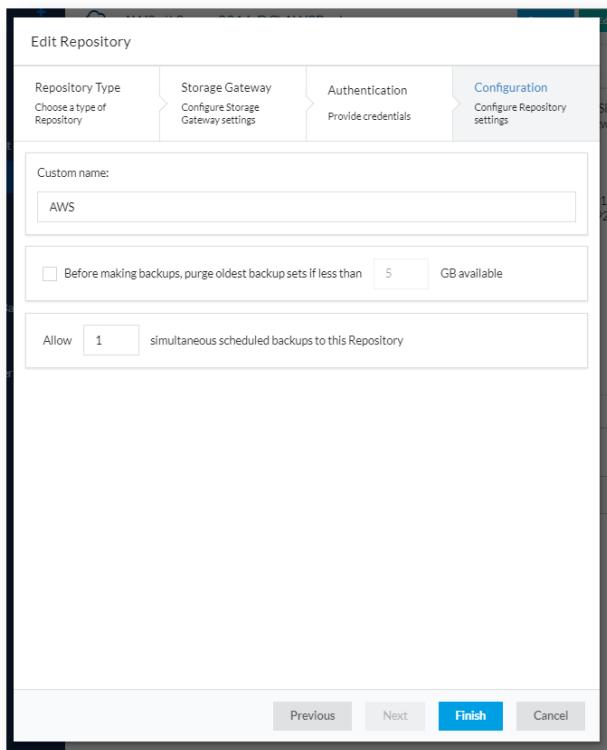

Optionally authentication information can be entered. This will be used for paths which require authentication such as Windows share paths.

Once this step has been completed, the next step is the final configuration page, described [here](#).

## Adding a new Repository - Final Steps

This page contains configuration options for how the Repository will be used by the scheduled backup system. This step is the same for all Repository types.

# Macrium Site Manager User Guide

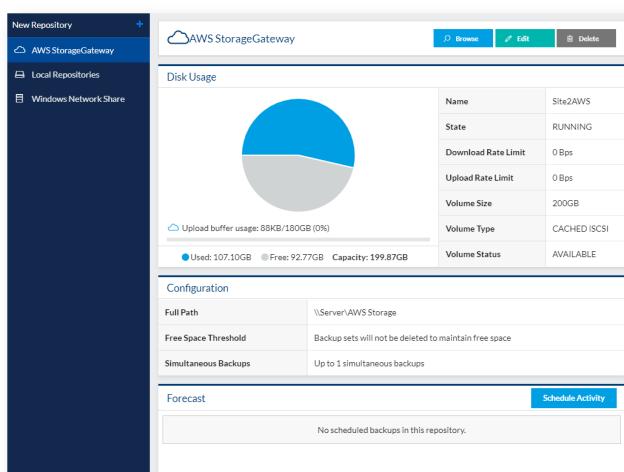

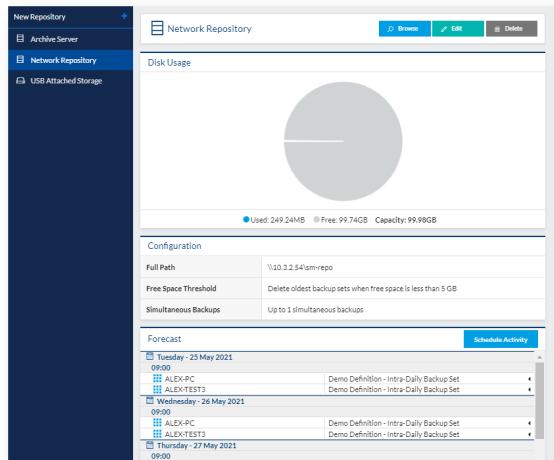

The available options are:

Option	Description
<b>Custom Name</b>	A name which will be displayed in the Site Manager interface for this repository. If left blank, it will default to the network path of the repository
<b>Purge oldest backup set(s)</b>	An optional value that will delete your old backups once the free space has reached a defined threshold.  <div style="border: 1px solid #ccc; padding: 5px; margin-left: 20px;"><i> ⓘ This setting is independent of any retention rules configured in Backup Definitions and applies to all activity to this repository.</i></div>
<b>Simultaneous Scheduled Backups</b>	This value sets the number of backups which can be performed to the repository simultaneously. The default value is 1, but it can be increased to a maximum of 10.

Once completed, the **Repository** can be saved by clicking the '**Finish**' button, which will return to the Repository list.

Once **Repositories** have been created, the interface shows the **Repository** list, as seen below

# Macrium Site Manager User Guide

For the **Amazon AWS Storage Gateway** Repository, the following additional data is available:

- Free space on the volume as a pie chart
- Upload buffer used/free
- Gateway information and statistics
- Volume information and statistics

## Viewing Repository Information

The Repository view shows information on the Repository which has been selected in the list on the left-hand side of the screen. This information consists of:

- **Repository Status** - Disk space used and any specific information for the selected repository.
- **Forecast** - A forecast of upcoming activity configured on the Scheduled Activity page is shown.

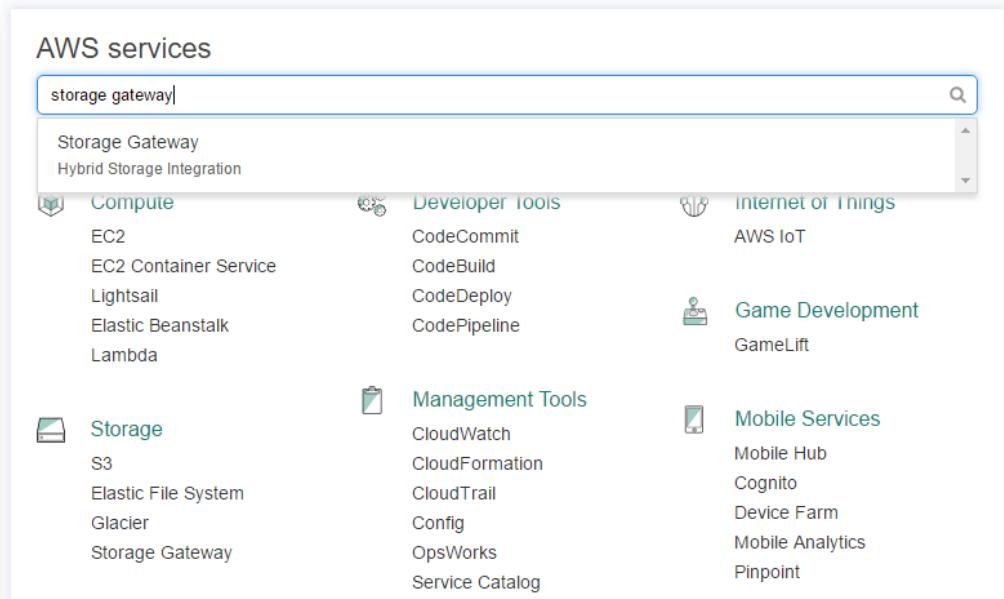

## Configuring AWS Storage Gateway

AWS Storage Gateway connects an on-premises software appliance with cloud-based storage. Macrium Site Manager can connect to a Volume Gateway via a iSCSI device mapped as a network share.

## Creating Your Gateway

This section describes the steps to create a AWS Gateway that can be used as a Site Manager repository.

After logging on to AWS, you will need to access the AWS Storage Gateway dashboard:

**Click the "Create gateway" button to start the "Create gateway" wizard:**

# Macrium Site Manager User Guide

Storage Gateway

Gateways

File shares

Volumes

Tapes

Create gateway Create file share Create volume Create tapes Actions

Name	Gateway ID	Status	Type	Storage resources
ParamountAWSGW	sgw-1b977272	Running	Volume cached	2 volumes

Details Tags

Select a gateway above.

In this example we are creating a volume gateway with cached volumes:

Select gateway type

Select host platform

Connect to gateway

Activate gateway

Configure local disks

Select gateway type

**File gateway**  
Store files as objects in Amazon S3, with a local cache for low-latency access to your most recently used data.

**Volume gateway**  
Block storage in Amazon S3 with point-in-time backups as Amazon EBS snapshots.

**Cached volumes**  
Low-latency access to your most recently used data.

**Stored volumes**  
On-premises data with scheduled offsite backups.

**Tape gateway**  
Back up your data to Amazon S3 and archive in Amazon Glacier using your existing tape-based processes.

Cancel Next

Amazon provide a virtual machine that will host the gateway. This is downloaded and added to your VM provider. In this example we are using Microsoft Hyper-V 2012

# Macrium Site Manager User Guide

Create gateway

Select gateway type

**Select host platform**

VMware ESXi

Microsoft Hyper-V 2008 R2

Microsoft Hyper-V 2012 Download image

Amazon EC2

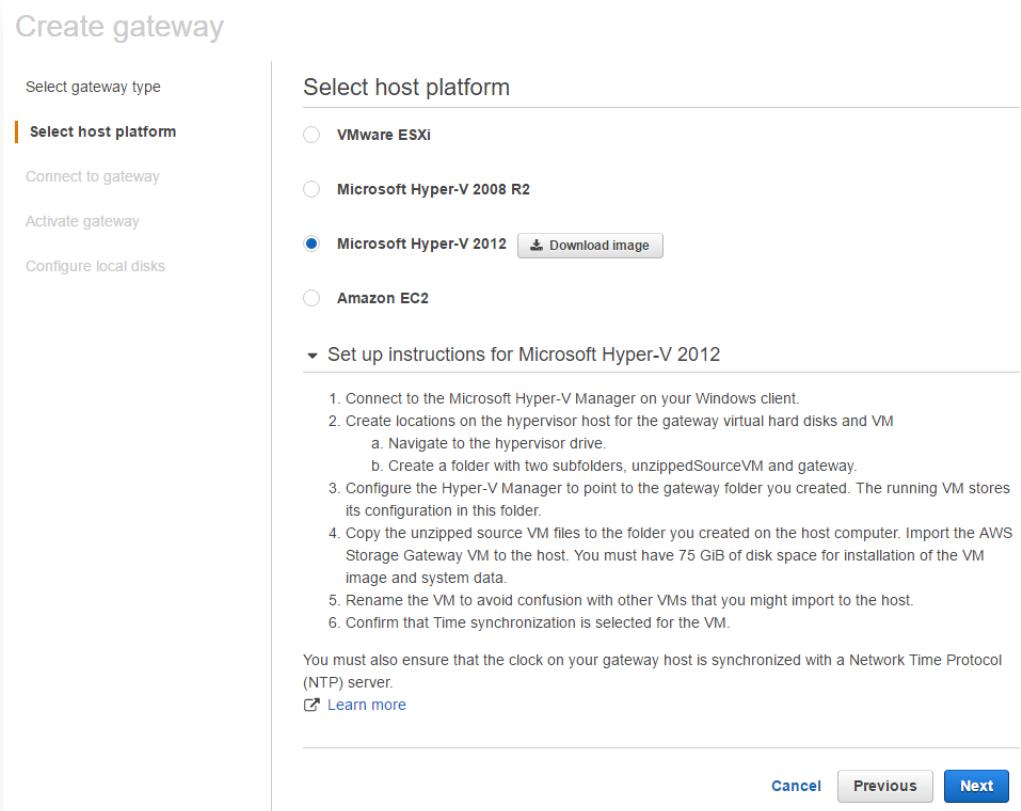

**Set up instructions for Microsoft Hyper-V 2012**

1. Connect to the Microsoft Hyper-V Manager on your Windows client.  
2. Create locations on the hypervisor host for the gateway virtual hard disks and VM  
a. Navigate to the hypervisor drive.  
b. Create a folder with two subfolders, unzippedSourceVM and gateway.  
3. Configure the Hyper-V Manager to point to the gateway folder you created. The running VM stores its configuration in this folder.  
4. Copy the unzipped source VM files to the folder you created on the host computer. Import the AWS Storage Gateway VM to the host. You must have 75 GiB of disk space for installation of the VM image and system data.  
5. Rename the VM to avoid confusion with other VMs that you might import to the host.  
6. Confirm that Time synchronization is selected for the VM.

You must also ensure that the clock on your gateway host is synchronized with a Network Time Protocol (NTP) server.

[Learn more](#)

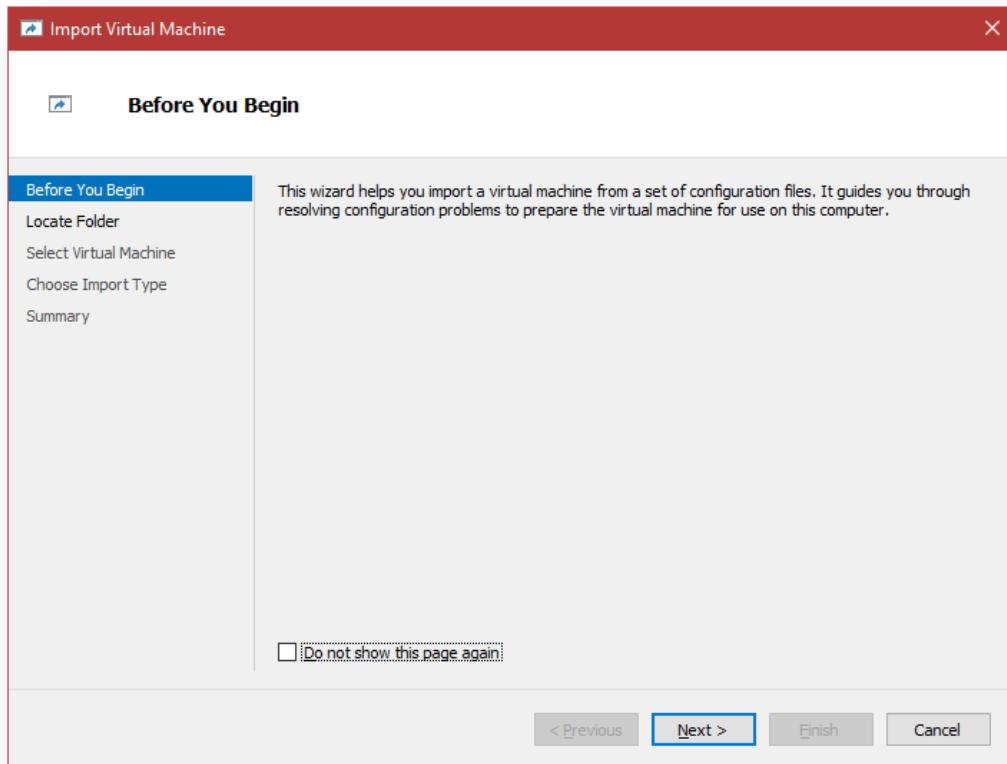

**Cancel** **Previous** **Next**

## Configuring the Gateway VM

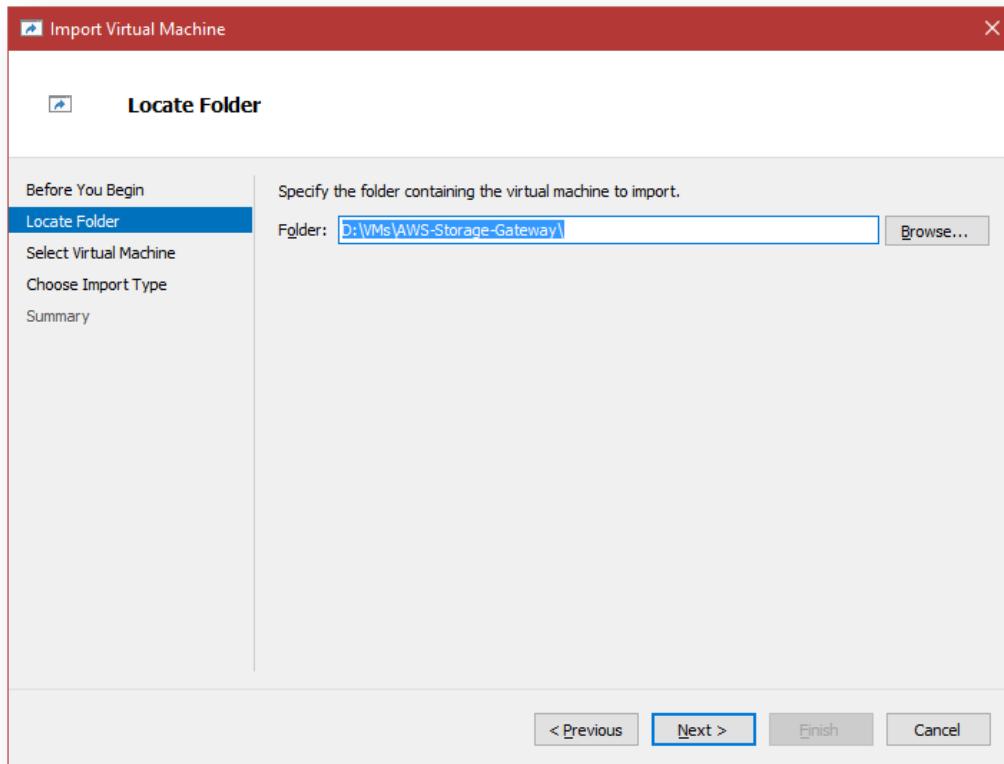

Once the VM image is downloaded, extract the contents of the zip file to disk and run the Hyper-V Manager to import the VM image.

# Macrium Site Manager User Guide

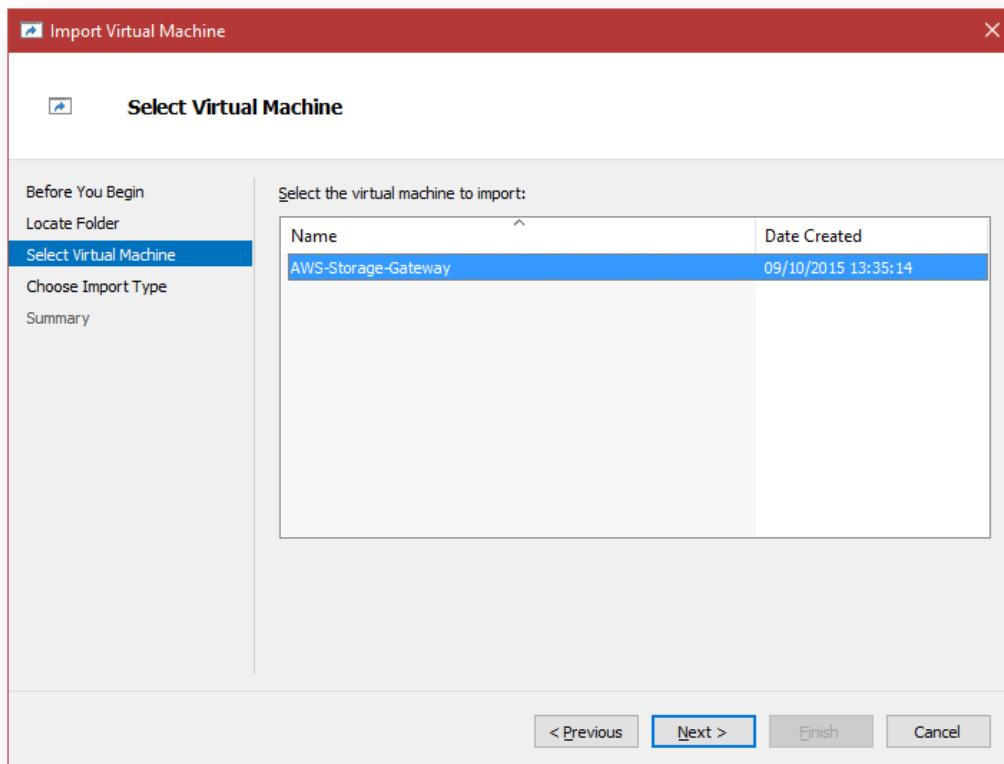

Specify the location where the zip file was extracted:

# Macrium Site Manager User Guide

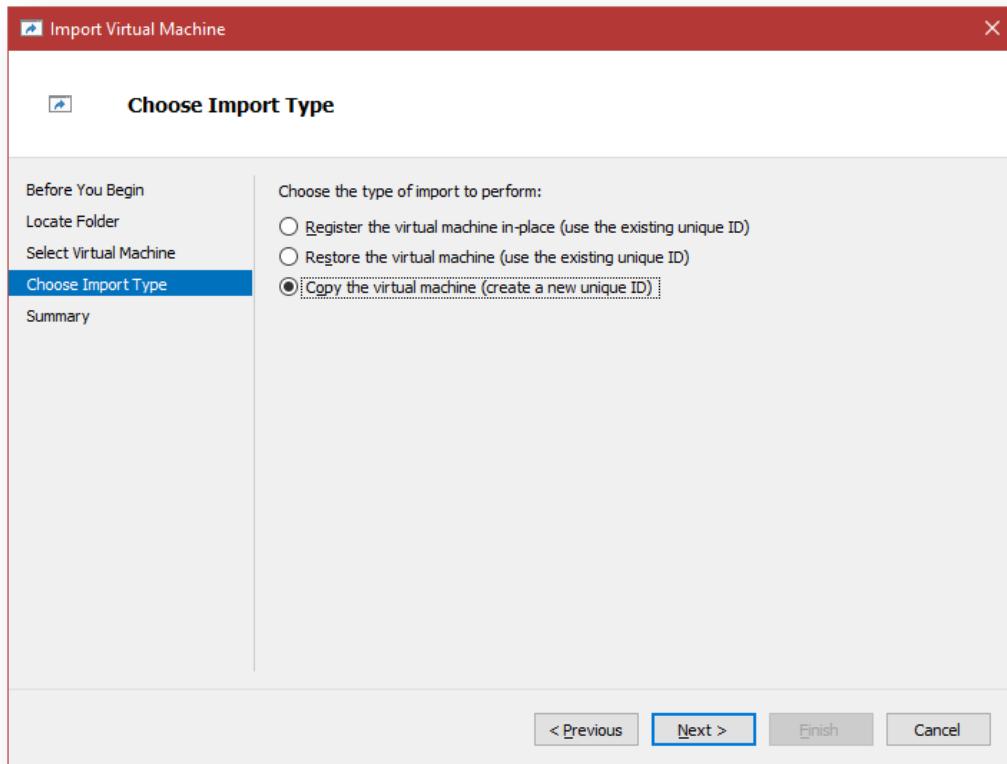

Select the "AWS-Storage-Gateway"

# Macrium Site Manager User Guide

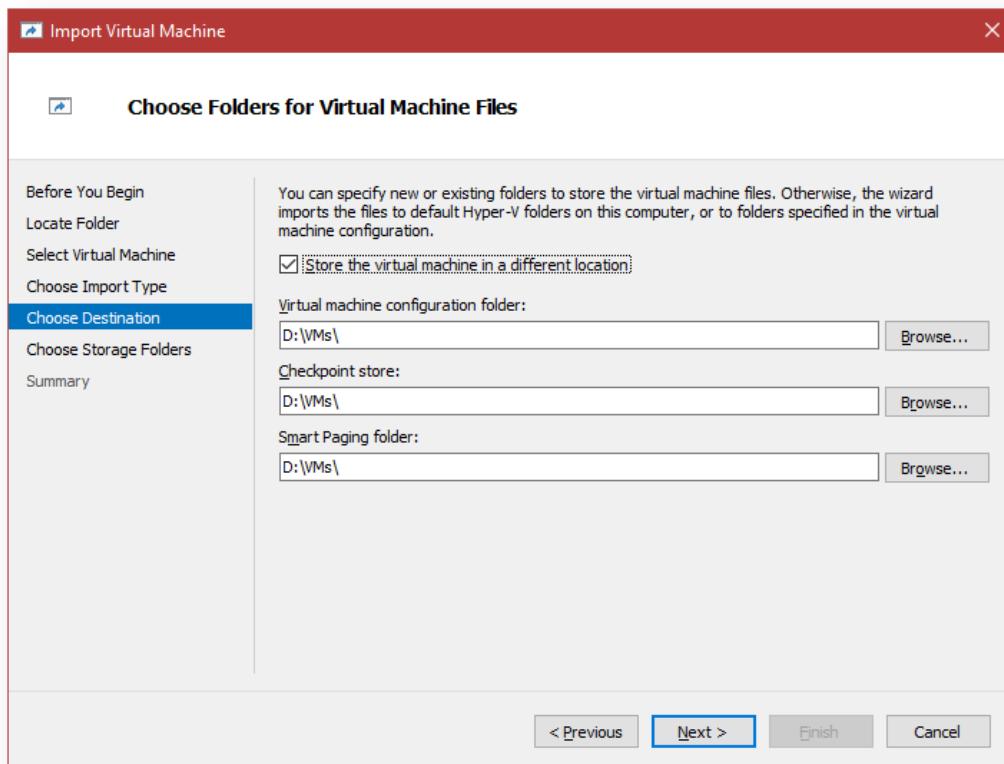

Create a copy of the VM to create a new unique ID for the VM

# Macrium Site Manager User Guide

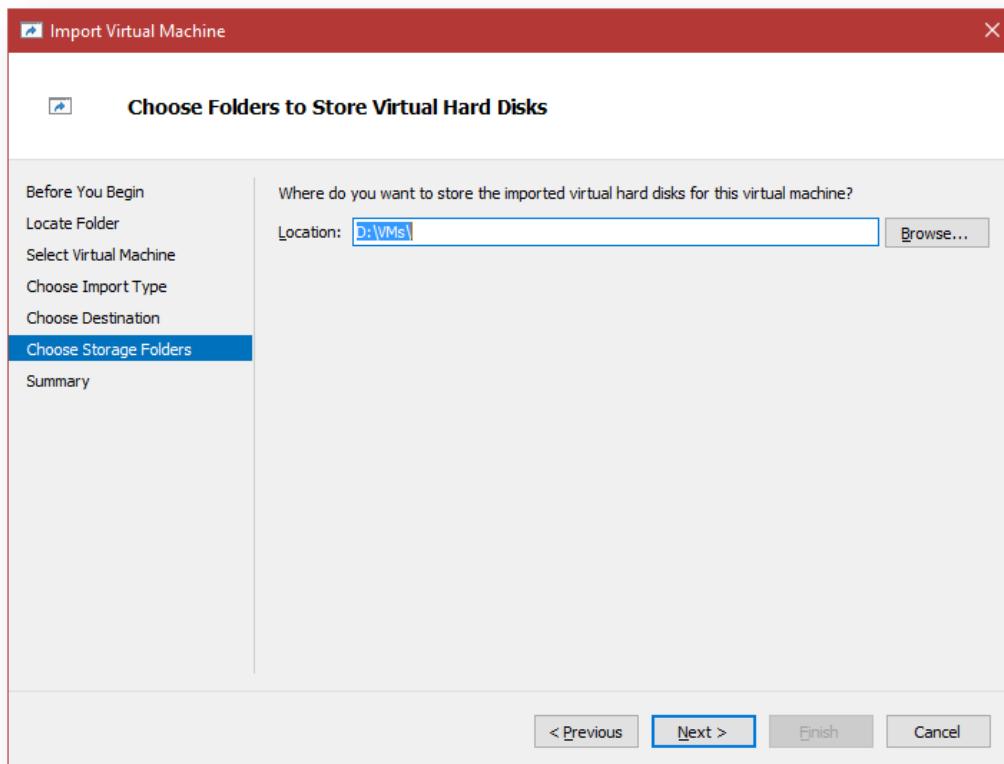

Specify the location where you want to save the VM

# Macrium Site Manager User Guide

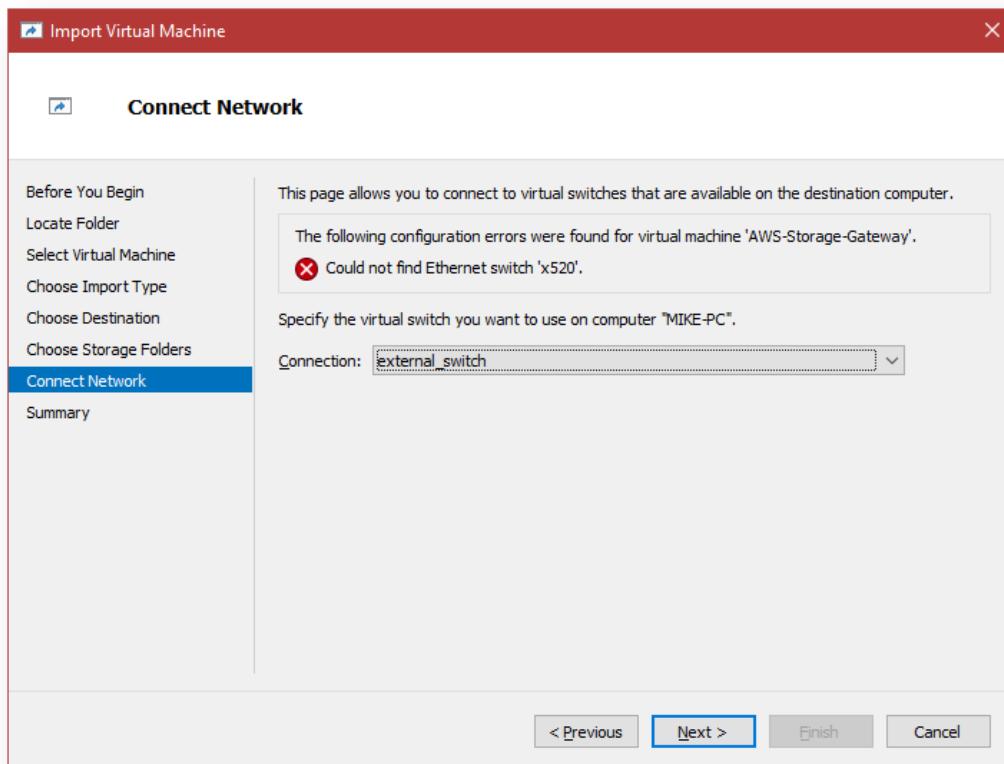

Specify the location where you want to save the VM hard disks

# Macrium Site Manager User Guide

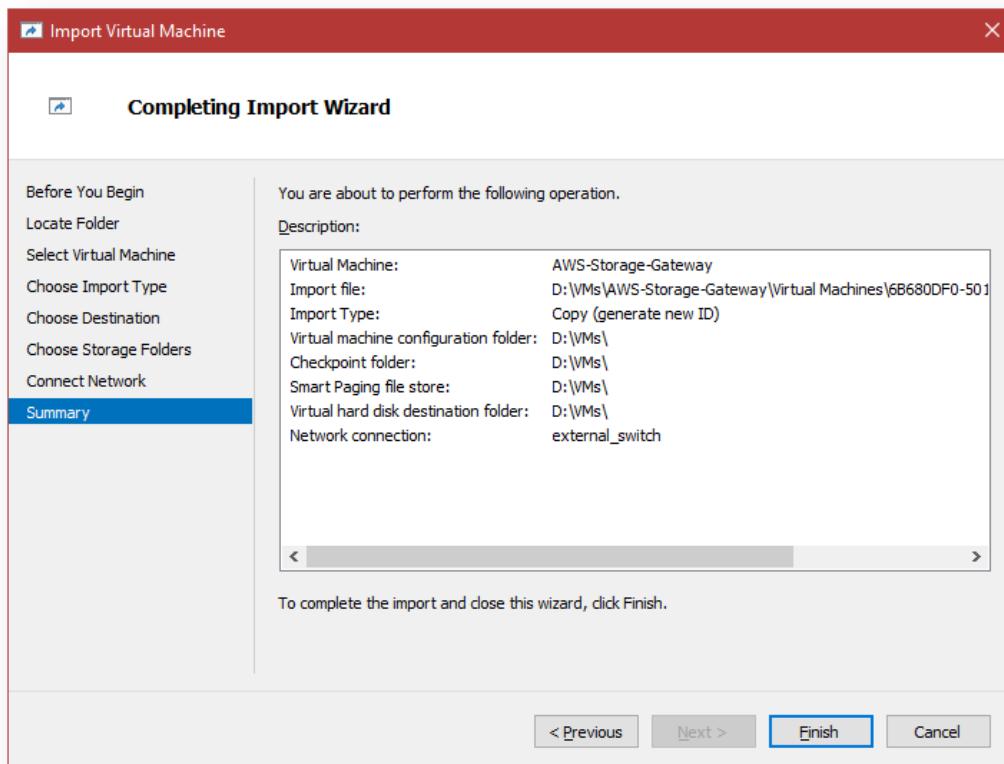

Ensure that you specify a network switch that is visible to the internet

# Macrium Site Manager User Guide

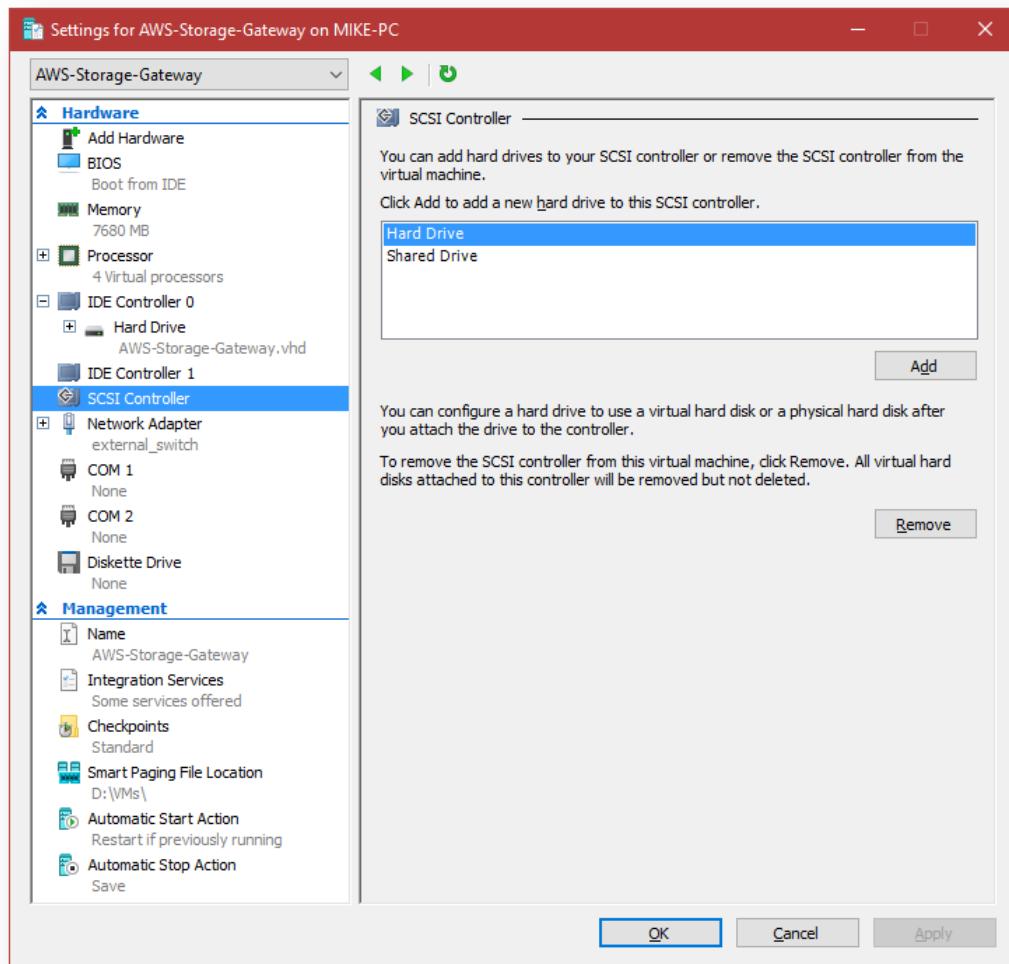

Click "Finish" to complete the VM creation process

# Macrium Site Manager User Guide

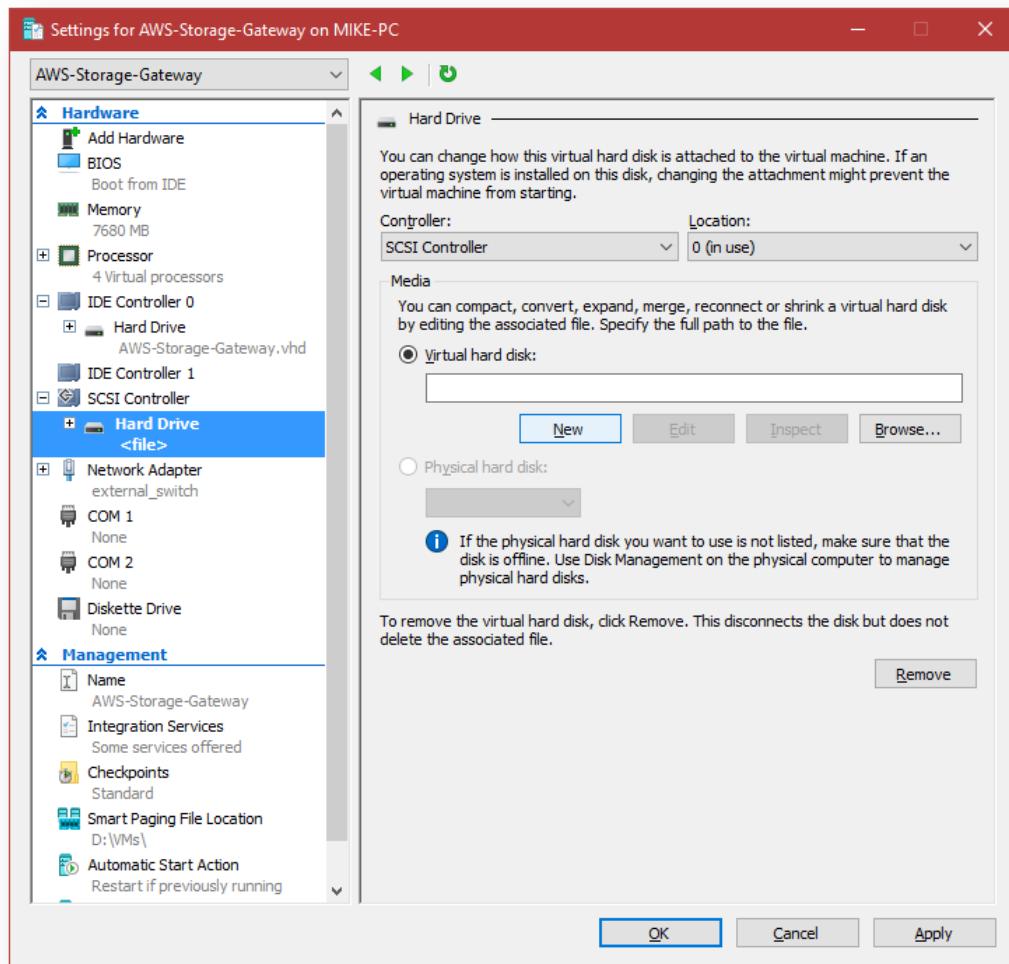

Once the VM is created two new virtual hard drives are required for the Volume Gateway. Edit the settings for the new VM and create two new hard drives.

# Macrium Site Manager User Guide

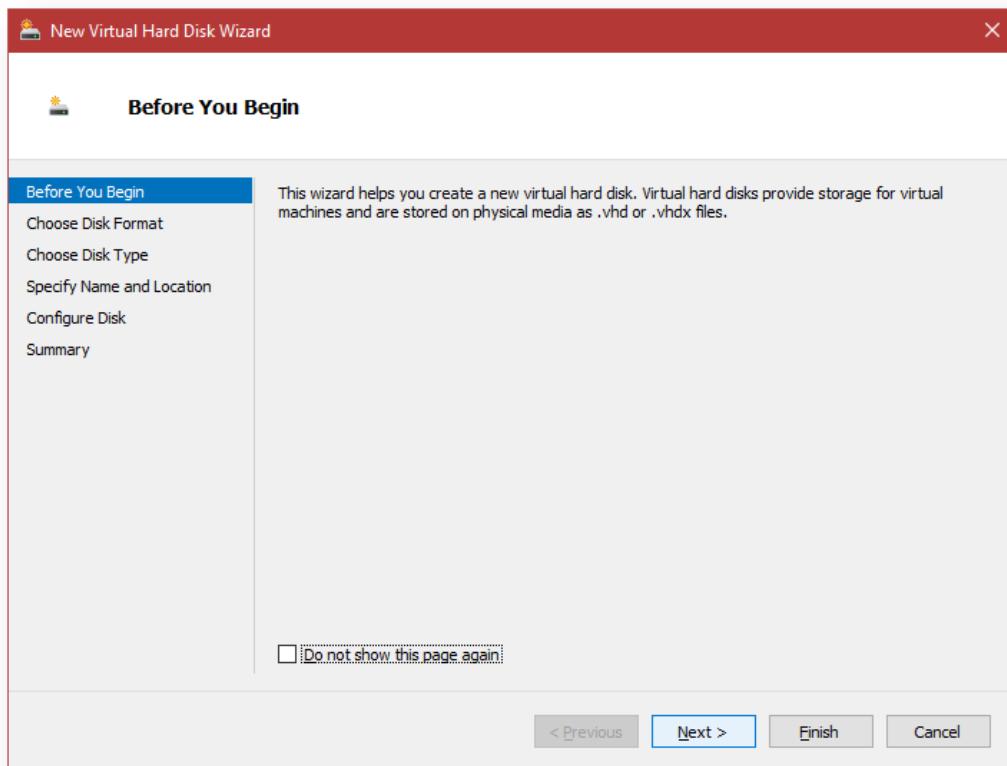

Create the hard drives on the SCSI Controller.

# Macrium Site Manager User Guide

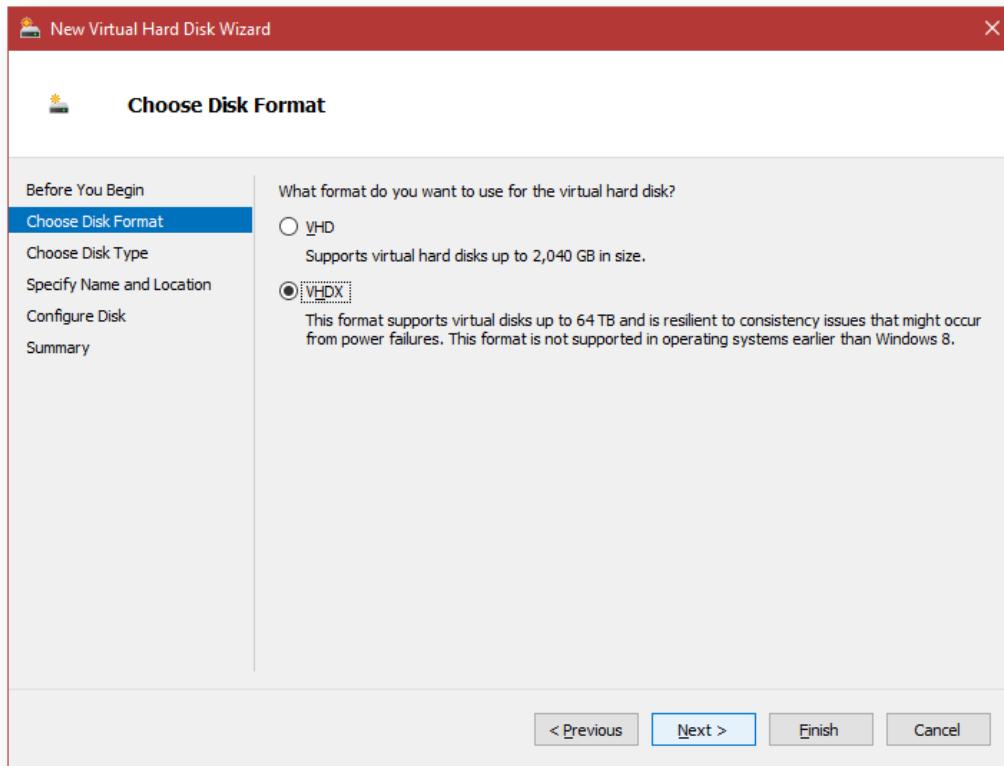

Click "Next" to continue.

# Macrium Site Manager User Guide

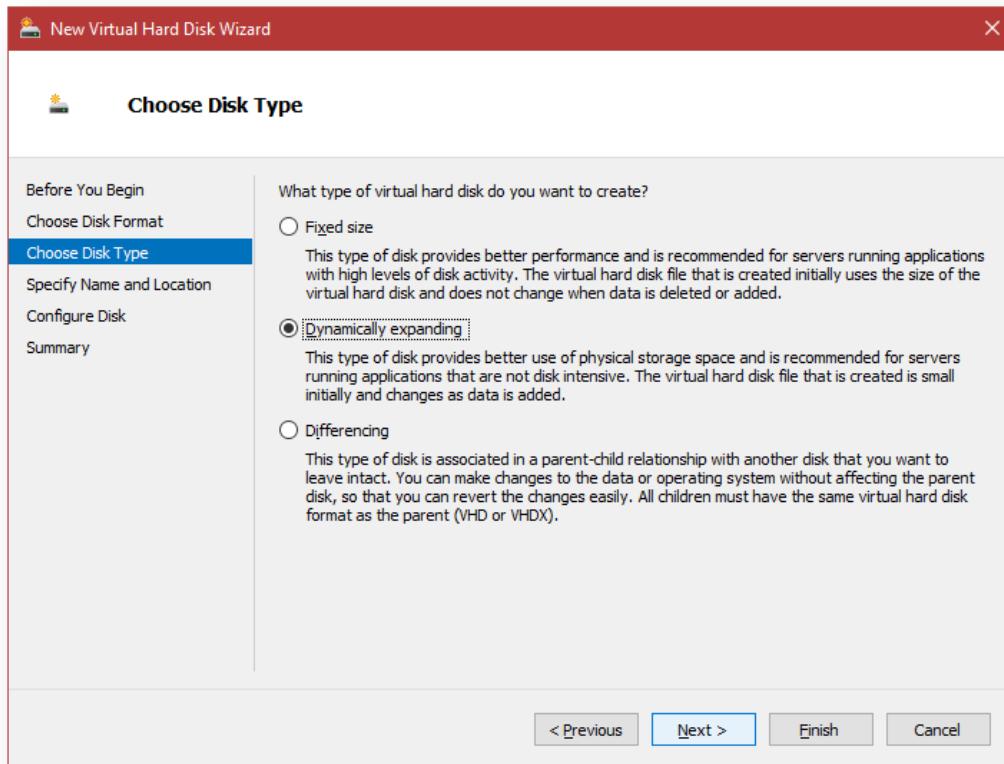

Specify the "VHDX" format for the disks.

# Macrium Site Manager User Guide

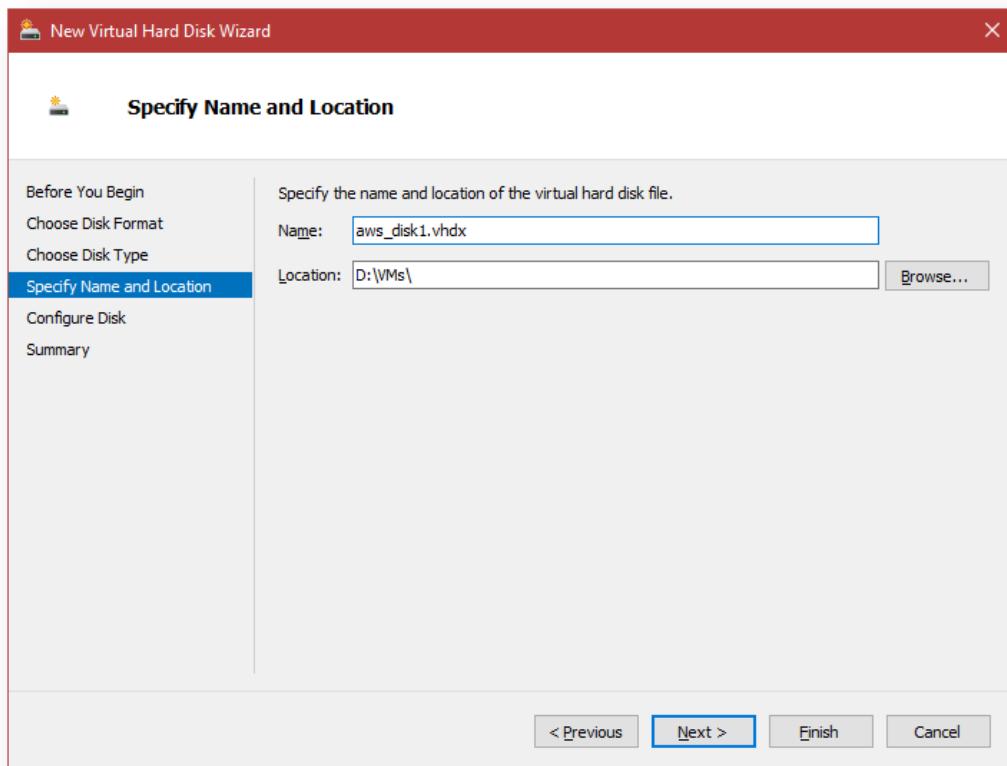

In this example the the disks will dynamically use physical disk space.

# Macrium Site Manager User Guide

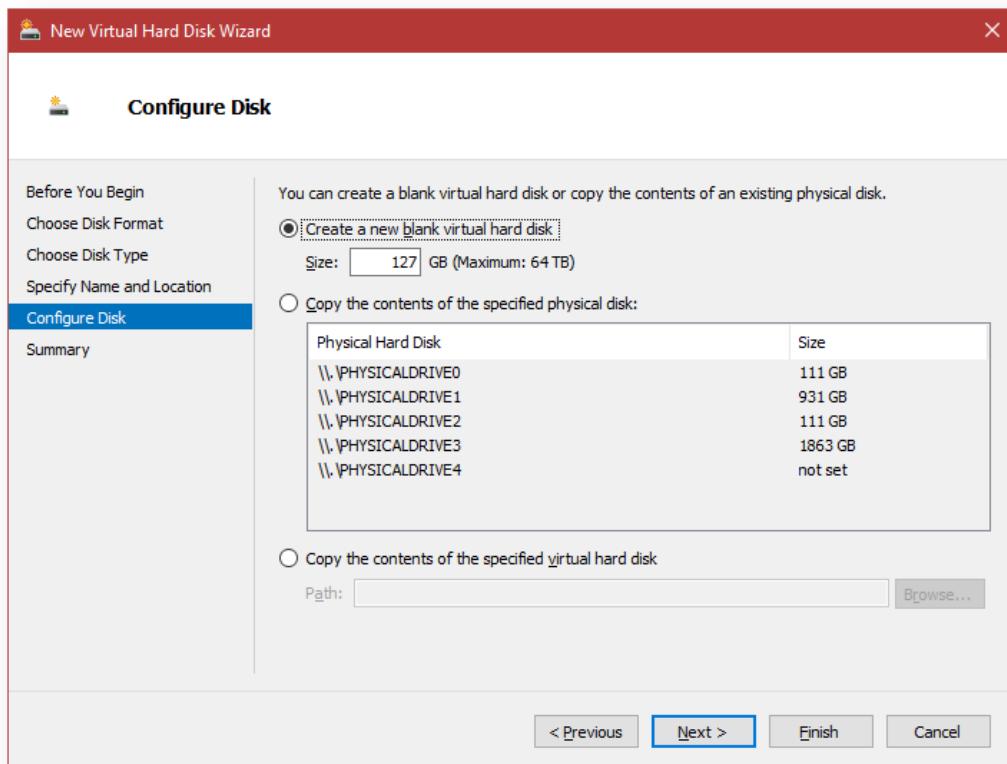

Specify location for the virtual disks.

# Macrium Site Manager User Guide

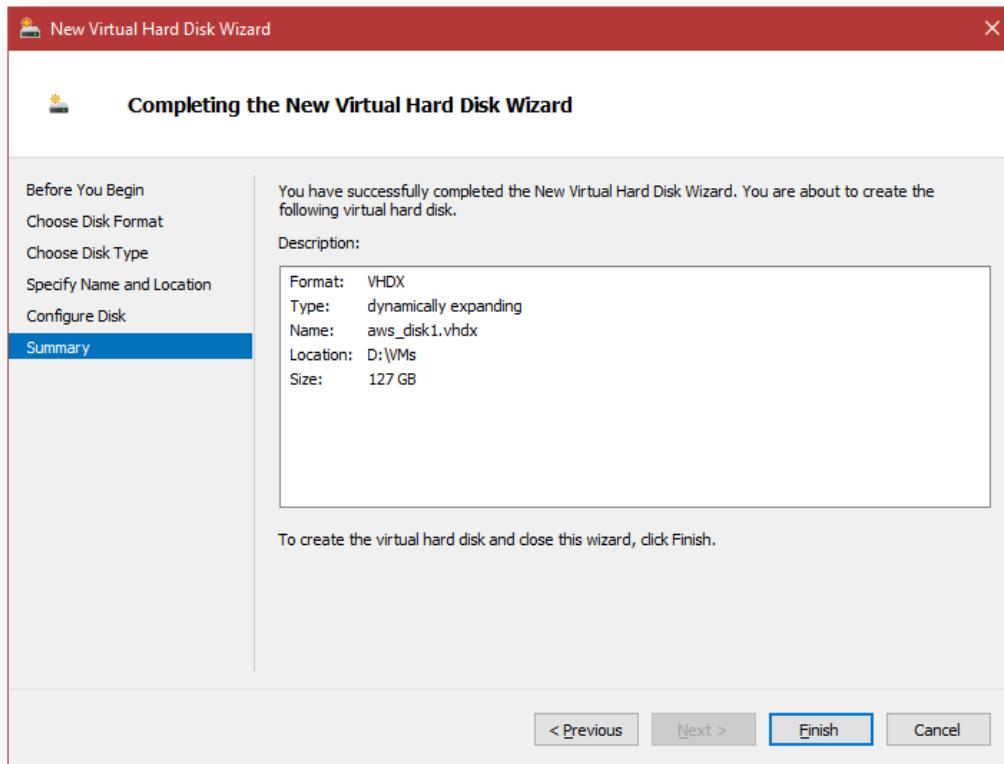

Specify the size of the virtual hard disk.

# Macrium Site Manager User Guide

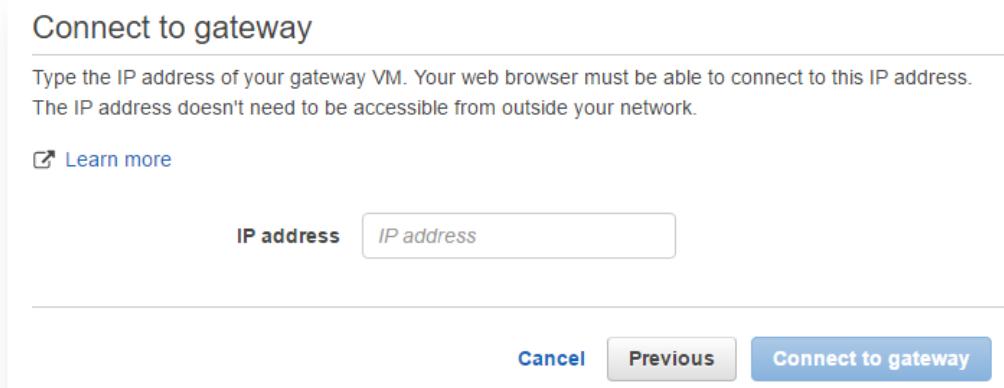

Click "Finish" to create the hard disk. *Repeat this process to create the second disk.*

# Macrium Site Manager User Guide

Once the VM is configured, creation of the gateway can continue by providing the IP address of the VM:

Specify the timezone for the gateway and provide a name:

# Macrium Site Manager User Guide

## Create gateway

Select gateway type

Select host platform

Connect to gateway

**Activate gateway**

Configure local disks

### Activate gateway

**Selected gateway configuration:** Cached gateway

The activation process securely associates your gateway with your AWS account. Activated gateways are billed every month and prorated daily. When you activate your first gateway, you can use the gateway for 60 days for free. This is a limited-time promotional offer. This limited-time promotional offer applies to the gateway usage pricing only. It does not apply to storage usage and data transfer usage. Storage and data transfer pricing applies when you start using your gateway.

[Learn more](#)

Gateway time zone

Gateway name

[Cancel](#)

**Activate gateway**

Once the gateway is activated, we need to specify which disk is the "Upload buffer", and which is the local "Cache":

## Create gateway

Select gateway type

Select host platform

Connect to gateway

Activate gateway

**Configure local disks**

 **Gateway is now active**

### Configure local disks

Choose the local disks on your gateway VM to use for upload buffer or cache storage.

[Learn more](#)

Disk ID	Capacity	Allocated to
SCSI (1:0)	127 GiB	<input type="button" value="Upload buffer"/>
SCSI (3:0)	127 GiB	<input type="button" value="Cache"/>

[Exit](#)

**Save and continue**

Once the settings are saved, the gateway will be fully created:

Successfully created gateway

**Gateways**

[Create gateway](#) [Create file share](#) [Create volume](#) [Create tapes](#) [Actions](#)

sgw-97987DFE					
Name	Gateway ID	Status	Type	Storage resources	
TestGateway	sgw-97987DFE	Running	Volume cached	0 volumes	

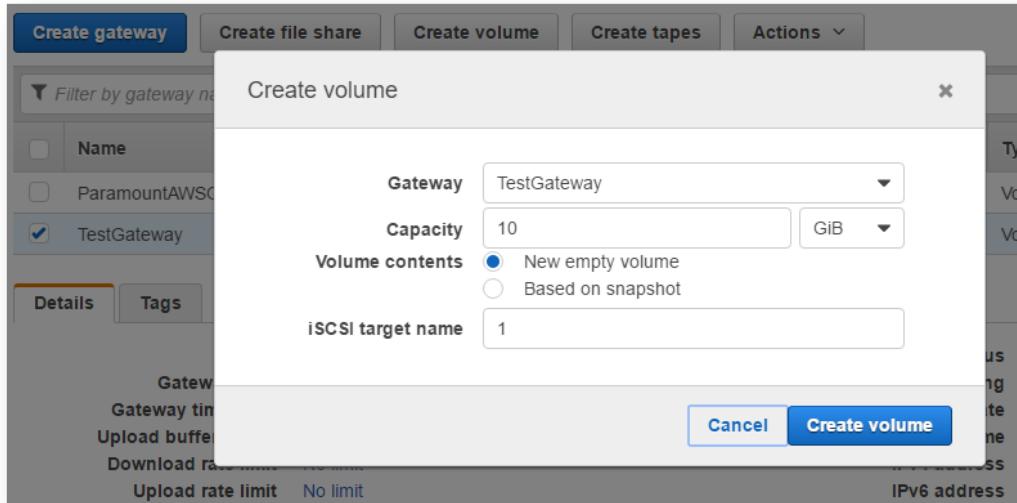

**Details** **Tags**

Name	TestGateway (sgw-97987DFE)	Status	Running
Gateway type	Volume cached	Monitoring	Cloudwatch
Gateway time zone	GMT	Last software update	-
Upload buffer usage	0 Bytes/127 GiB (0.00%)	Maintenance start time	Monday 00:54 GMT
Download rate limit	No limit	IPv4 address	10.3.2.34
Upload rate limit	No limit	IPv6 address	-

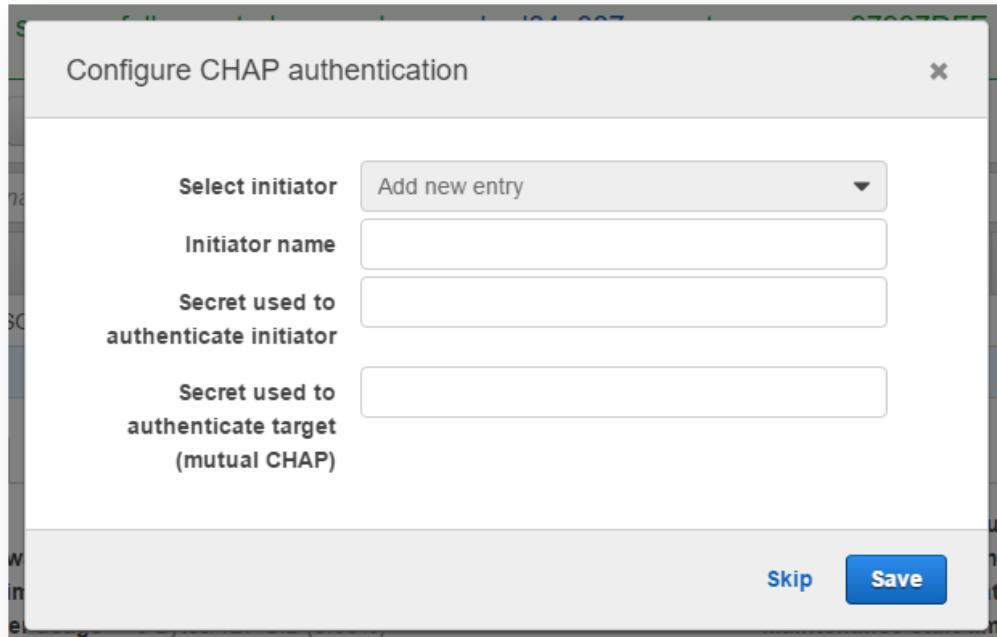

# Macrium Site Manager User Guide

## Create a Volume

Once the gateway is created, we need to add a volume to the gateway by **clicking "Create volume" button**. After selecting the gateway, and specifying the capacity, **click the "Create volume" button**:

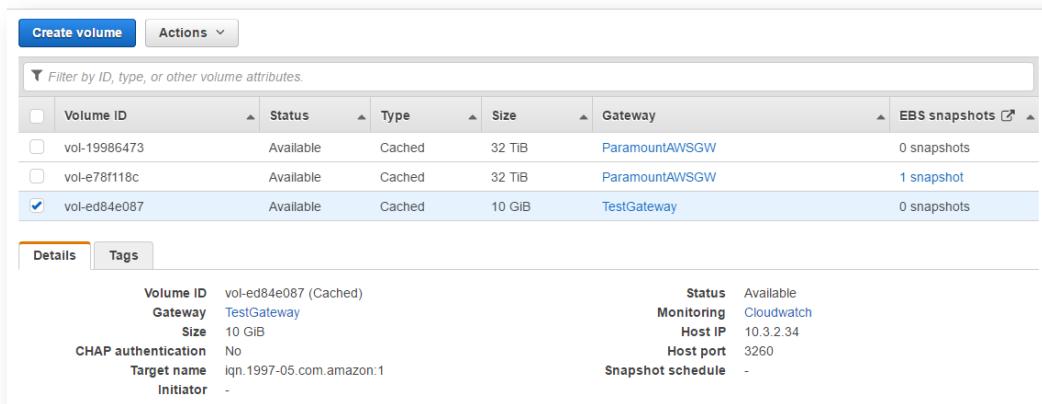

The volume can optionally be authenticated using CHAP, or saved for immediate use:

Once you have created a volume on the gateway, you can setup a network share for the volume on the VM and create a Amazon AWS Storage Gateway repository within Site Manager.

# Macrium Site Manager User Guide

The screenshot shows the Macrium Site Manager interface. At the top, there is a 'Create volume' button and an 'Actions' dropdown. Below this is a search bar with the placeholder 'Filter by ID, type, or other volume attributes.' A table lists three volumes:

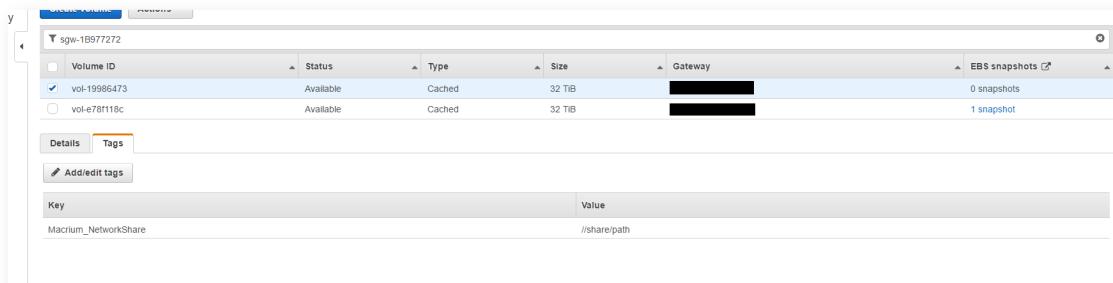

Volume ID	Status	Type	Size	Gateway	EBS snapshots
vol-19986473	Available	Cached	32 TiB	ParamountAWSGW	0 snapshots
vol-e78f118c	Available	Cached	32 TiB	ParamountAWSGW	1 snapshot
<b>vol-ed84e087</b>	Available	Cached	10 GiB	TestGateway	0 snapshots

Below the table, there are 'Details' and 'Tags' tabs. The 'Details' tab is selected, showing the following information for the selected volume:

Volume ID	vol-ed84e087 (Cached)	Status	Available
Gateway	TestGateway	Monitoring	Cloudwatch
Size	10 GiB	Host IP	10.3.2.34
CHAP authentication	No	Host port	3260
Target name	iqn.1997-05.com.amazon:1	Snapshot schedule	-
Initiator	-		

To automatically connect an UNC share to an S3 volume, a Tag has to be created for the S3 volume.

This tag must have key equal to "Macrium\_NetworkShare" and back slashes must be replaced with forward slashes.

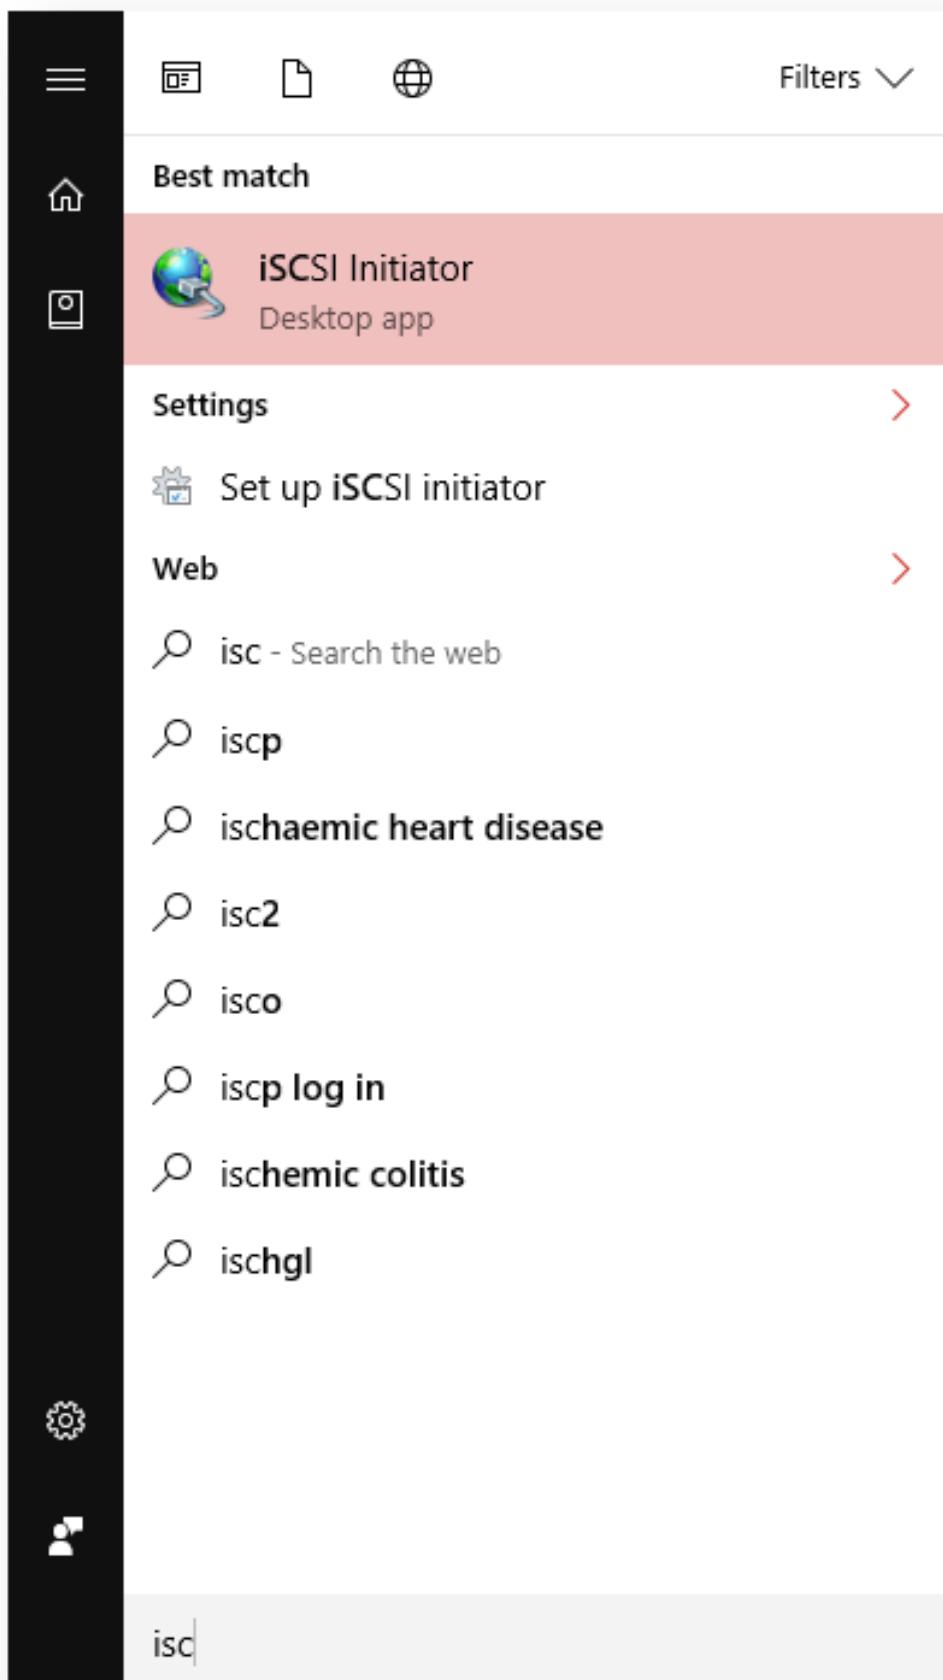

The screenshot shows the Macrium Site Manager interface. The 'Tags' tab is selected. A table lists the same three volumes as before. Below the table, there is a 'Add/edit tags' button. A table shows the tag for the selected volume:

Key	Value
Macrium_NetworkShare	//share/path

## Creating an iSCSI Initiator

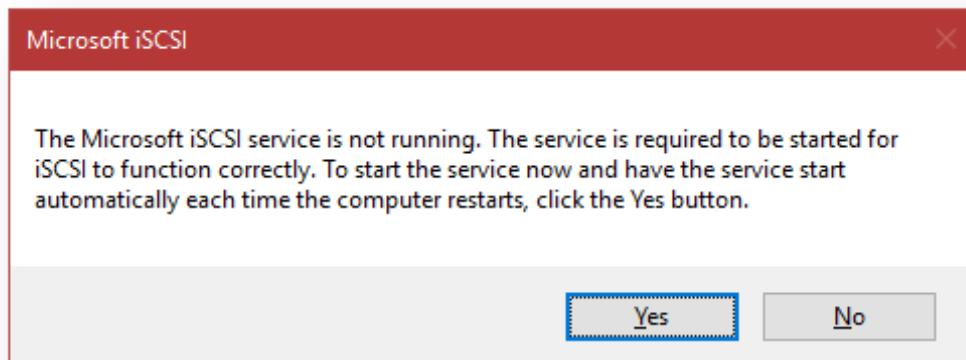

Launch the iSCSI control panel (iscsicpl.exe) from the Windows Start menu.

# Macrium Site Manager User Guide

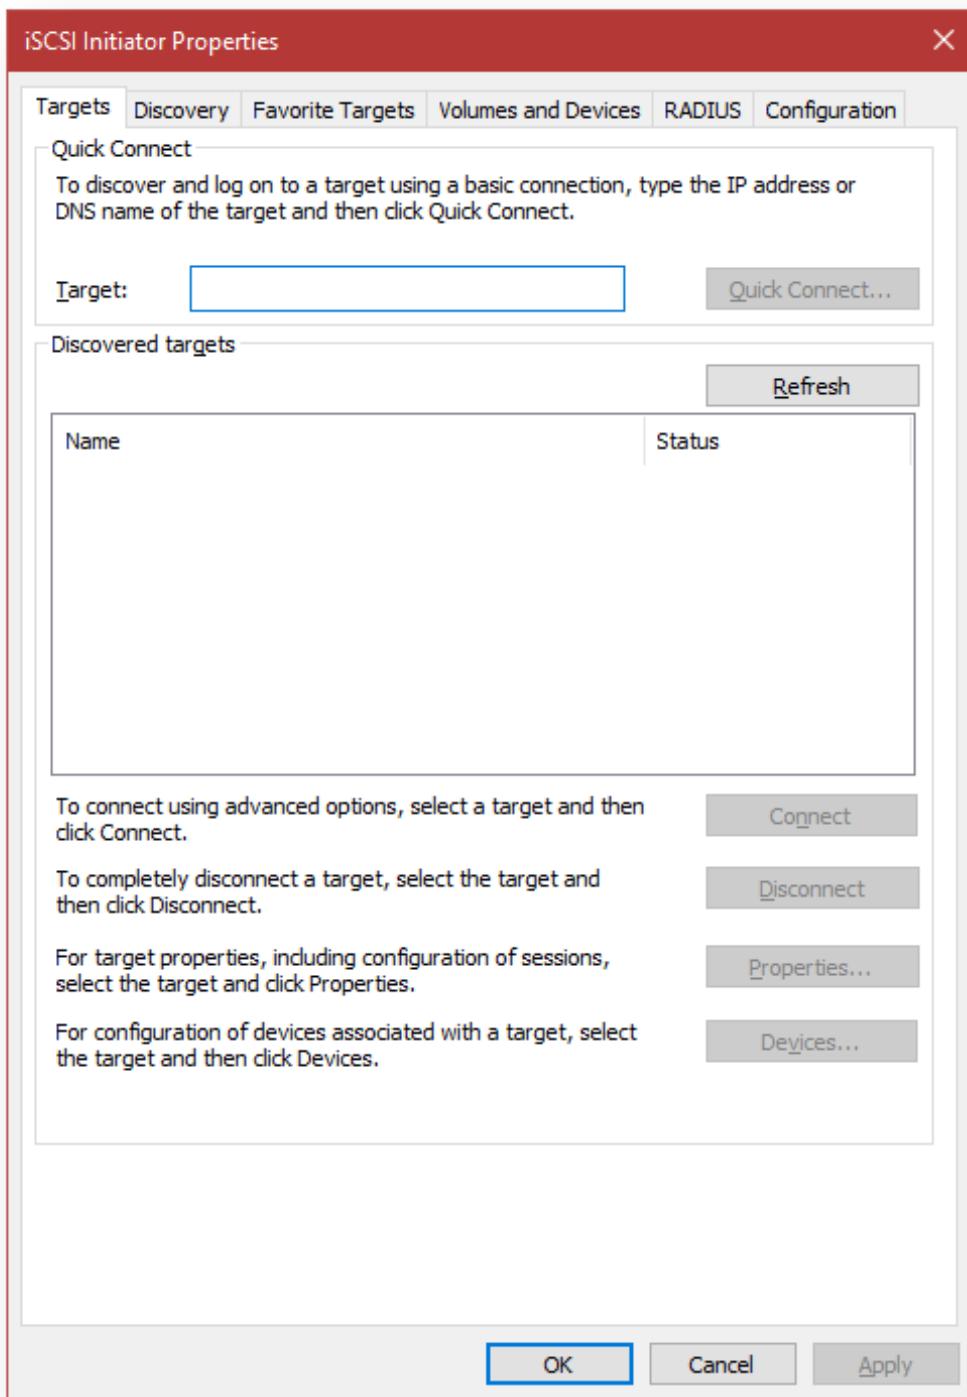

# Macrium Site Manager User Guide

If the iSCSI service is not running you will be prompted to start the service.

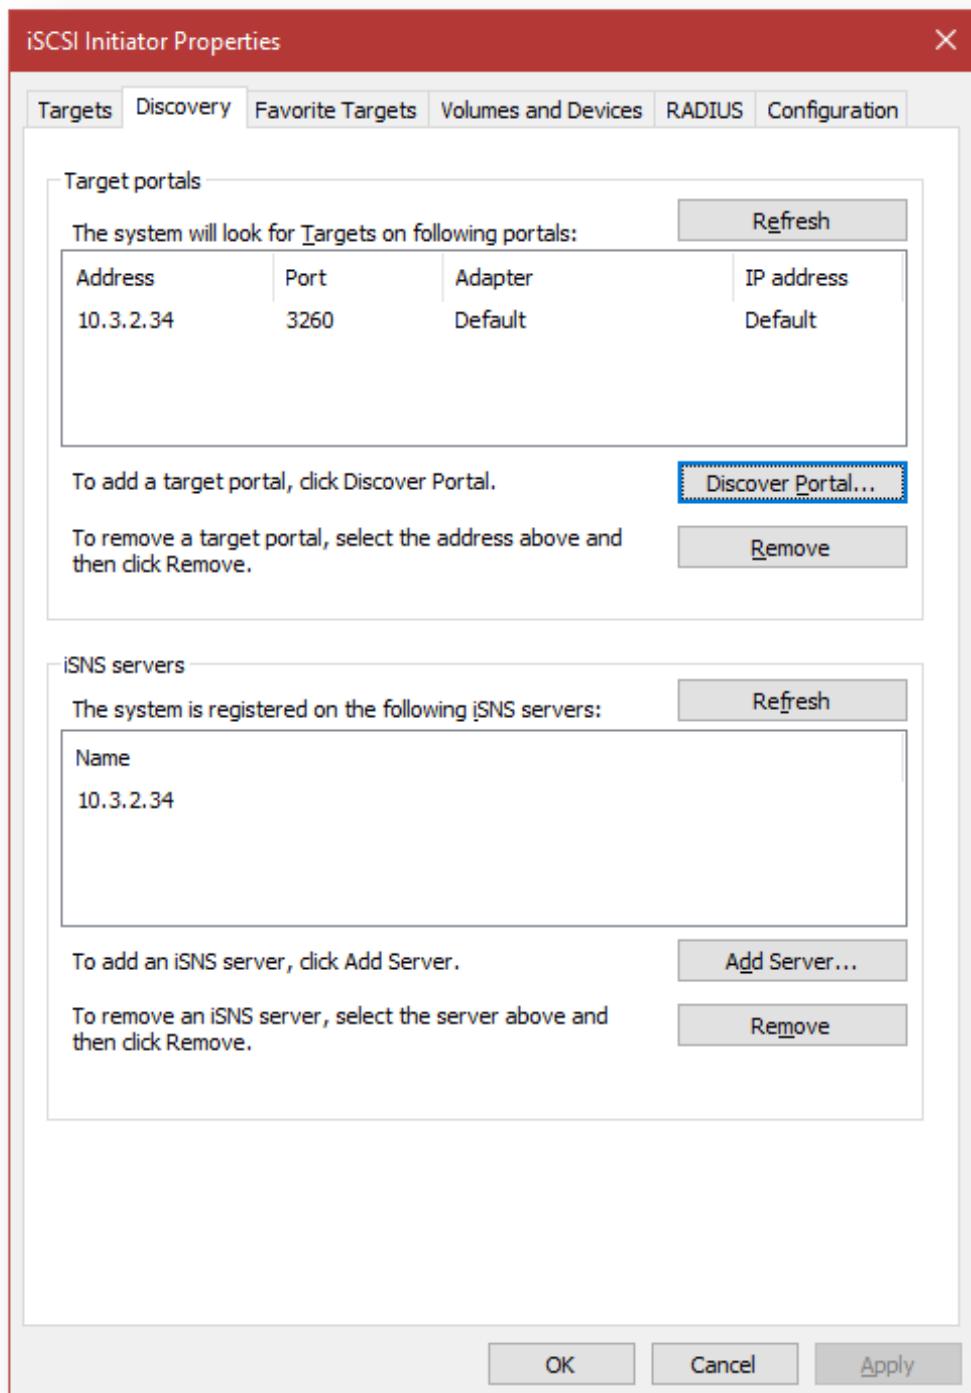

Click on the "Discovery" tab to locate the iSCSI targets.

# Macrium Site Manager User Guide

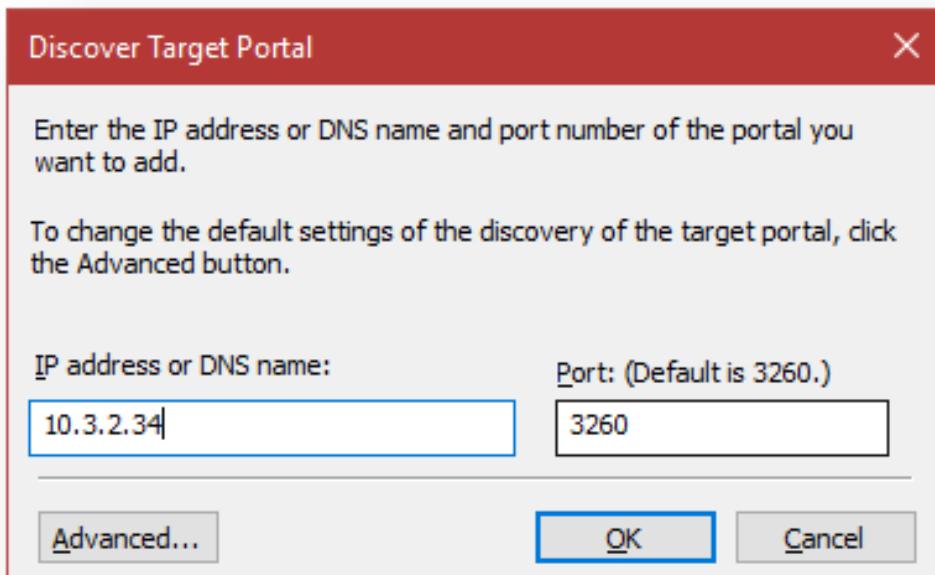

# Macrium Site Manager User Guide

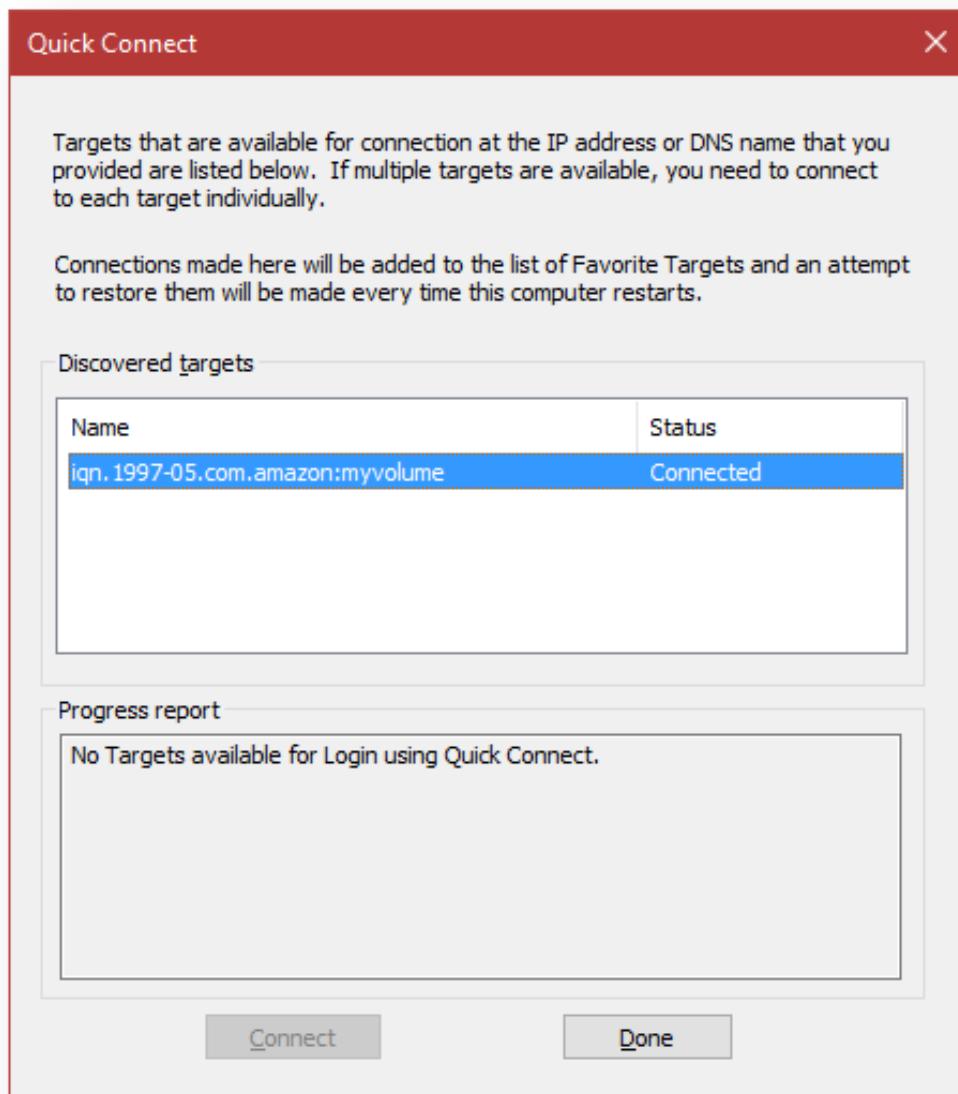

Specify the IP address of the VM.

## Macrium Site Manager User Guide

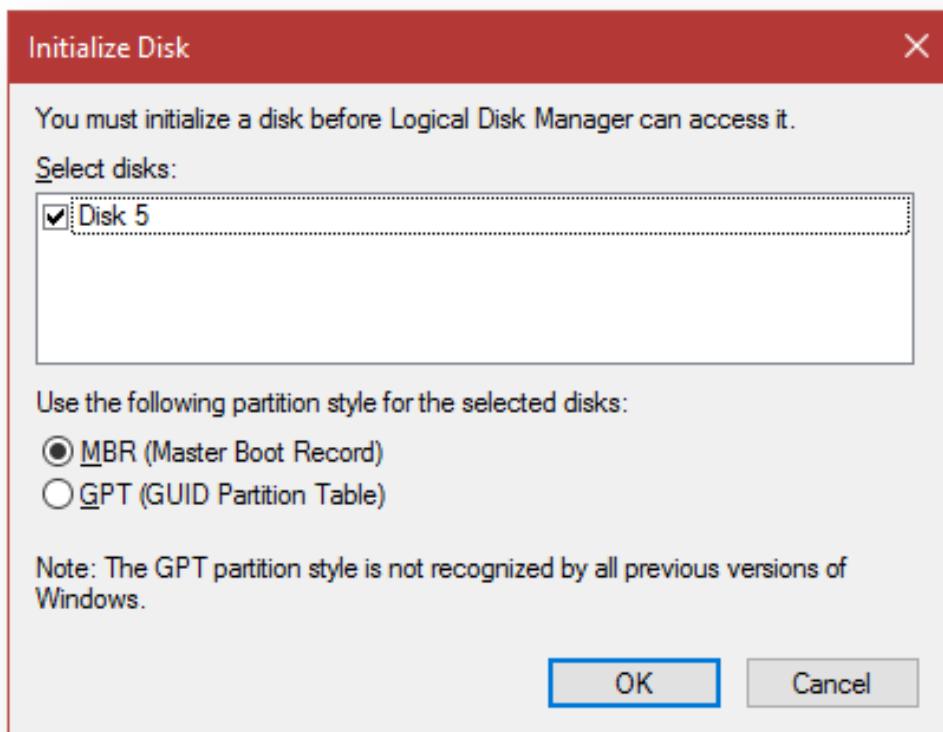

Switch back to the "Targets" tab, and click "Quick Connect". Connect to the iSCSI volume, then click "Done". the iSCSI will now create a iSCSI reference to the Volume gateway volumes and will be visible to the Windows client.

# Macrium Site Manager User Guide

After you have connected to the iSCSI volume, run "diskmgmt.msc". When Disk Management starts it detects the iSCSI Disk and prompts you to initialise it.

# Macrium Site Manager User Guide

Once the disk is initialised, it can be formatted and assigned a driver letter and shared across the network as a UNC share.

## Scheduled Activity

- Introduction
- Scheduling Backups
- Viewing Scheduled Backup Status
  - Enabling/Disabling the Scheduled Backup
  - Running the Scheduled Backup on Demand
  - Deleting the Scheduled Backup
  - Preview Section
  - Backup Status Section
  - Scheduling Remote Synchronization

# Macrium Site Manager User Guide

## Introduction

The Scheduled Activity page is used to create, view and manage any regularly scheduled activity configured using the Backup Definitions, Schedules and Repositories configured in Site Manager.

The following activities can be scheduled:

Activity	Description
Backup	Backups are scheduled by selecting a Backup Definition to define what gets backed up and a Schedule to control when the backups happen.
Remote Synchronization	Remote Synchronization can be scheduled to synchronize the contents of a Repository to an external server or disk.  <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"><span style="color: yellow; font-size: 2em;">⚠</span> Only one Remote Synchronization can be scheduled for each Repository.  Repositories of the <b>Local</b> type cannot have Remote Synchronization as the data in these Repositories is spread across multiple machines.</div>

The left hand menu for this page shows a list of Repositories, with each scheduled item listed underneath. Each scheduled activity item is color coded to show status:

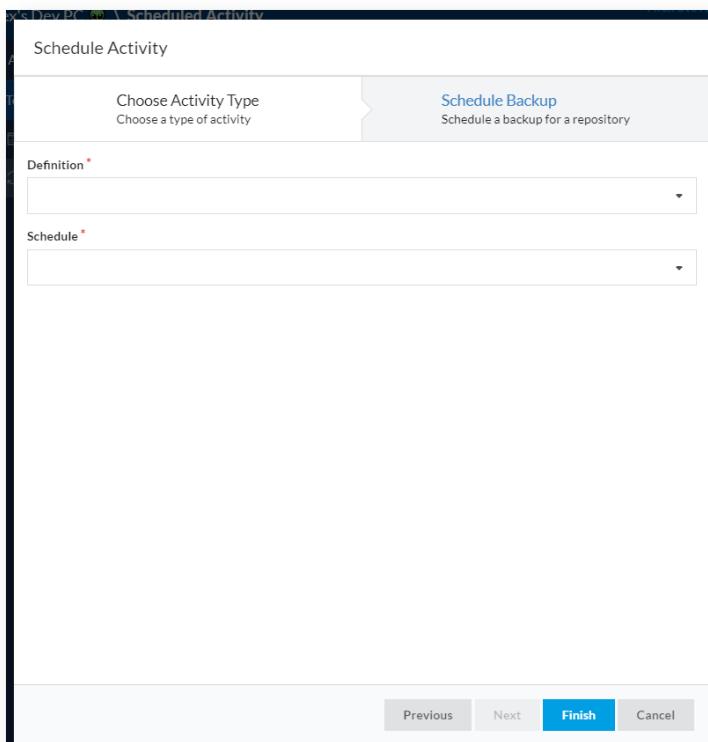

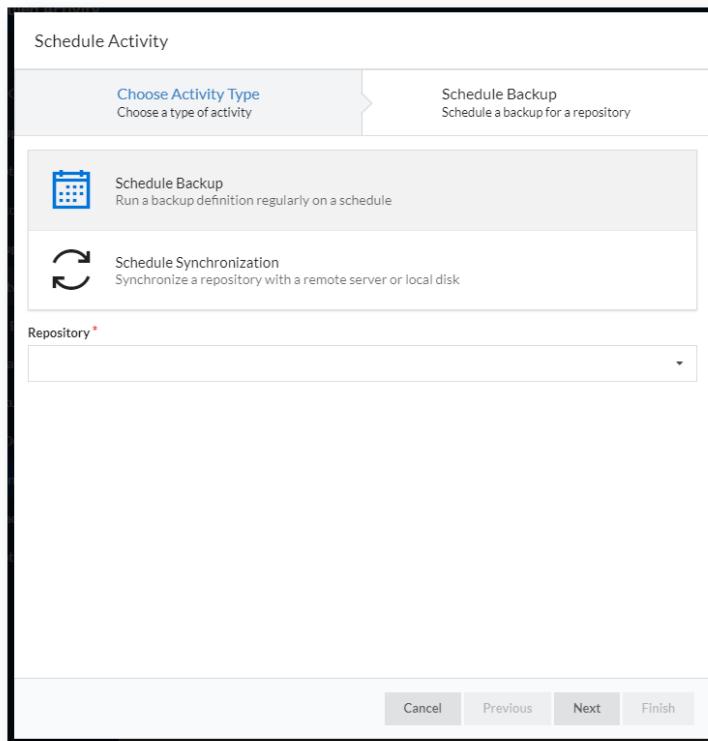

# Macrium Site Manager User Guide

Colour	Meaning
Red	An error has occurred - for example, one computers in a the scheduled backup encountered an error during backup
Green	The scheduled activity is successful
Gray	The activity is disabled or has not yet run for the first time

## Scheduling Backups

Backups can be scheduled by selecting the **New Activity** option at the top of the left-hand side panel, or selecting the **Schedule Backup** option under each Repository. If using the former method, the page below is shown. If **Schedule Backup** is used, this stage is skipped.

# Macrium Site Manager User Guide

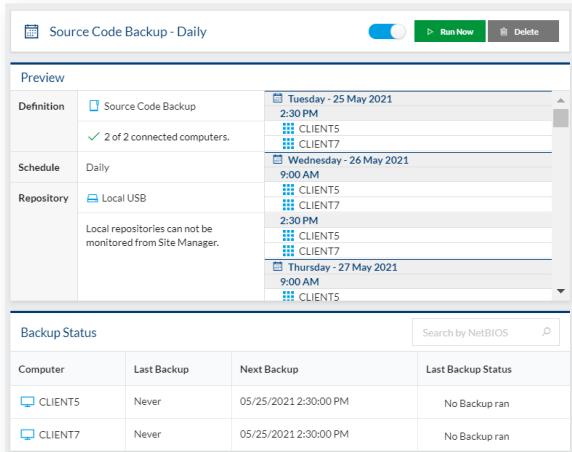

# Macrium Site Manager User Guide

Once a Repository is selected and **Schedule Backup** is selected, the second wizard page is shown, where the Definition and Schedule can be selected. Once they are picked from the drop-down list, the wizard can be finished and the newly scheduled backup will appear in the list under the repository with the name of the Definition and Schedule.

## Viewing Scheduled Backup Status

When a scheduled backup is selected, the view below is shown:

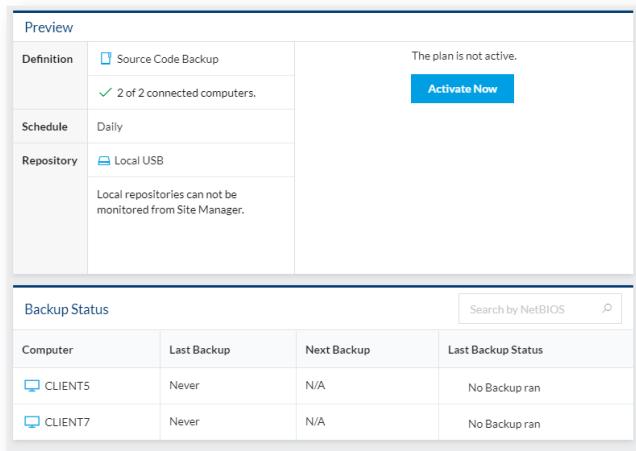

Computer	Last Backup	Next Backup	Last Backup Status
CLIENT5	Never	05/25/2021 2:30:00 PM	No Backup ran
CLIENT7	Never	05/25/2021 2:30:00 PM	No Backup ran

This contains a header, plus a **Preview** and a **Backup Status** section.

## Enabling/Disabling the Scheduled Backup

The backup may be disabled or enabled by clicking the toggle in the header bar. When the backup is disabled, the Preview pane will indicate this:

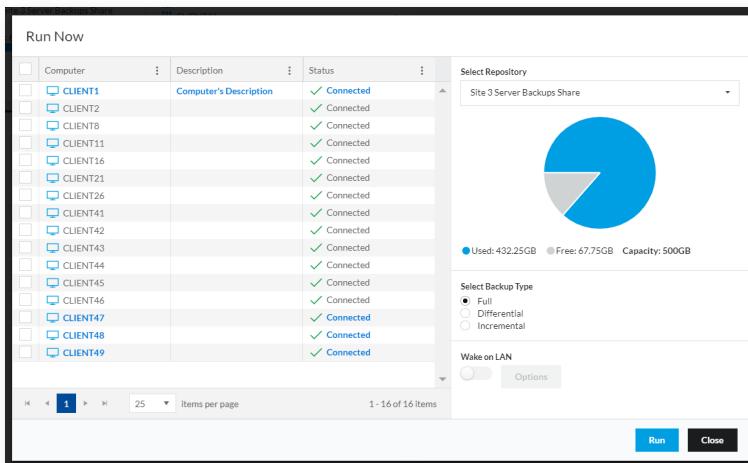

Computer	Last Backup	Next Backup	Last Backup Status
CLIENT5	Never	N/A	No Backup ran
CLIENT7	Never	N/A	No Backup ran

# Macrium Site Manager User Guide

## Running the Scheduled Backup on Demand

The **Run Now** option in the header allows one or more of the computers to start a backup now, rather than at the next scheduled time. This will bring up the **Run Now** dialog:

After selecting the computers and type of backup (Full, Differential or Incremental), pressing **Run** will start the backups.

Note that backups may not run immediately based on simultaneous backup limits in Repository settings.

Disconnected computers will wait until connection to run.

Computers must be connected to perform a Run Now backup unless the Wake-on-LAN option is set. See [Backup Definitions](#) for more information on Run Now backups

## Deleting the Scheduled Backup

The Scheduled Backup can be deleted, preventing any further backups.

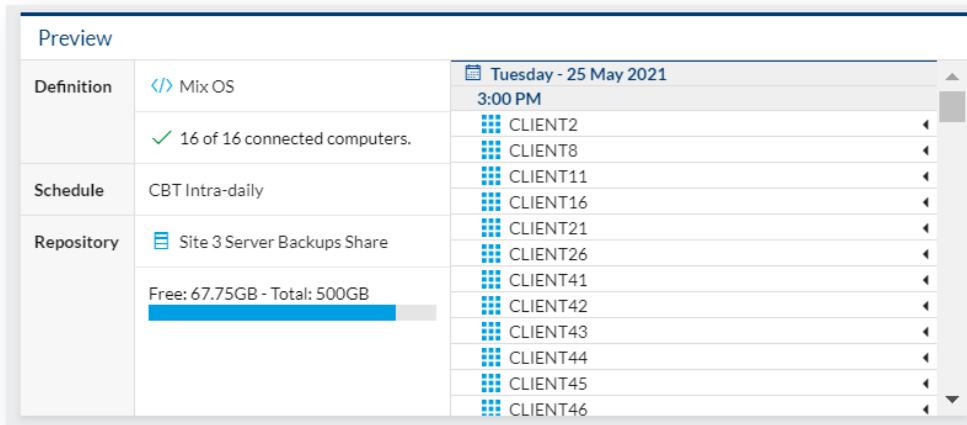

Backup files created in the repository are not deleted by deleting the scheduled backup. They are only deleted through the browse feature of the repository or if manually deleted.

## Preview Section

The preview contains a summary of information about the scheduled backup:

# Macrium Site Manager User Guide

This contains the following information:

Heading	Description
Definition	The Backup Definition used by this scheduled backup, along with some information on the number of computers and their overall status
Schedule	The Schedule used by this scheduled backup
Repository	The Repository the backups will be stored in, along with free space information
Right Hand Panel	If the backup is active, it will show a forecast for this backup plan, if inactive it will indicate this. The forecast here shows only the backups for the selected backup schedule. To see a forecast of all activity to a repository, use the <b>Repository</b> or <b>Dashboard</b> pages.

## Backup Status Section

This section contains the last backup information for each computer in the scheduled backup:

# Macrium Site Manager User Guide

Backup Status			
Computer	Last Backup	Next Backup	Last Backup Status
CLIENT11	31/05/2018 14:21	21/08/2019 14:21	✗ Failed
CLIENT10	31/05/2018 14:21	21/08/2019 14:21	✓ Success
CLIENT2	31/05/2018 14:21	21/08/2019 14:21	✓ Success
CLIENT3	31/05/2018 14:21	21/08/2019 14:21	✓ Success
CLIENT5	31/05/2018 14:21	21/08/2019 14:21	✓ Success
CLIENT4	31/05/2018 14:21	21/08/2019 14:21	✓ Success
CLIENT6	31/05/2018 14:21	21/08/2019 14:21	✓ Success
CLIENT8	31/05/2018 14:21	21/08/2019 14:21	✓ Success
CLIENT9	31/05/2018 14:21	21/08/2019 14:21	✓ Success
CLIENT13	Never	21/08/2019 14:21	No Backup ran
CLIENT1	Never	21/08/2019 14:21	No Backup ran

Each computer lists:

- Last backup time
- Last backup status - Success, Failure or Succeeded with warnings
- Next scheduled backup time

## Scheduling Remote Synchronization

Remote Synchronization can be configured through the **New Activity** wizard, or through selecting the **No Remote Sync** entry under the appropriate repository and clicking **Configure Synchronization**. Remote Synchronization is covered in detail in [this article](#).

## Synchronizing a Repository with a Remote Server

- Overview
- Configuring Remote Synchronization
  - Stage 1 - Activity Type
  - Stage 2 - Synchronization Type
  - Stage 3 - Connection Details
  - Stage 4 - Configuration

  - Current Server Status
  - Last Synchronization Results
- Viewing a Synchronization in Progress
- Common Issues and Fixes
  - Synchronization Failures

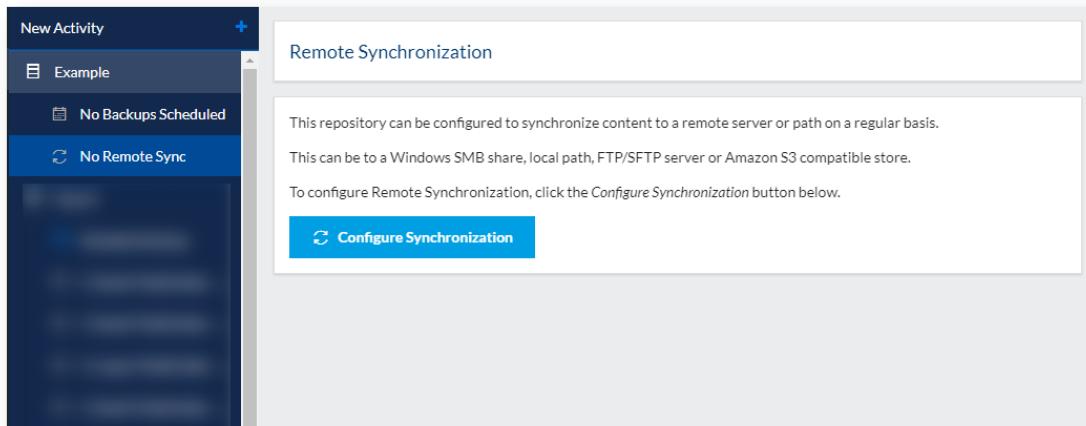

# Macrium Site Manager User Guide

- Full Backup Files are Synchronized When Creating Incremental Backups
- Remote Server ID mismatch

## Overview

Site Manager can automatically synchronize all backups stored in a Repository to a remote server or disk on a daily basis. This can be used to efficiently ensure that offsite replication of backup data is performed. The Site Manager server will manage stopping backups on the server and ensuring that the synchronization process has a consistent view of the Repository. The synchronization process will also manage failed and partially uploaded files and ensure the remote copy of the Repository is always in a consistent state.

This feature can be accessed through the Scheduled Activity page and is configured on a per-Repository basis:

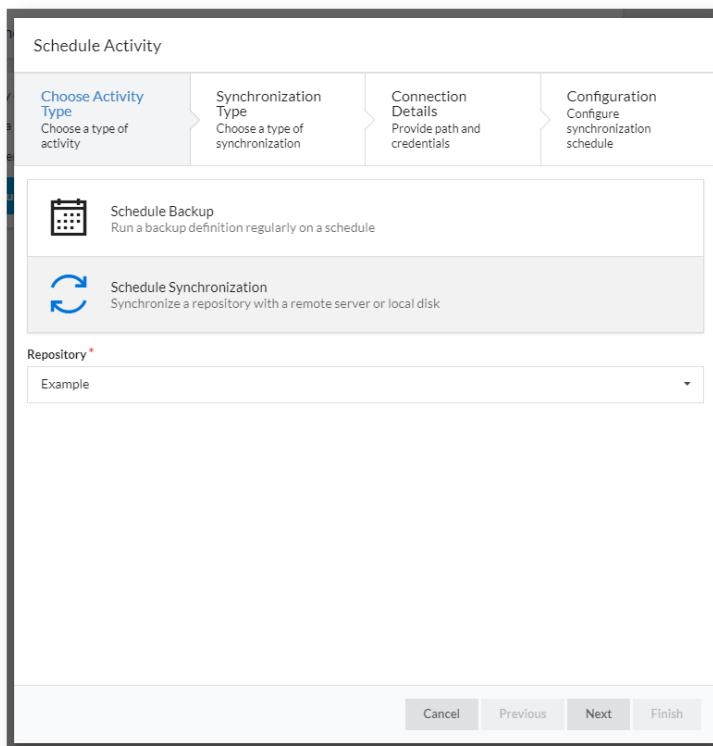

## Configuring Remote Synchronization

The **Scheduled Activity** page has an entry for each Repository (except Local Repositories) which will either display information on the remote synchronization configuration or offer the option of creating a new remote synchronization. Clicking **New Activity** or **Configure Synchronization** will display the Synchronization Setup wizard. The steps of this wizard are described below:

### Stage 1 - Activity Type

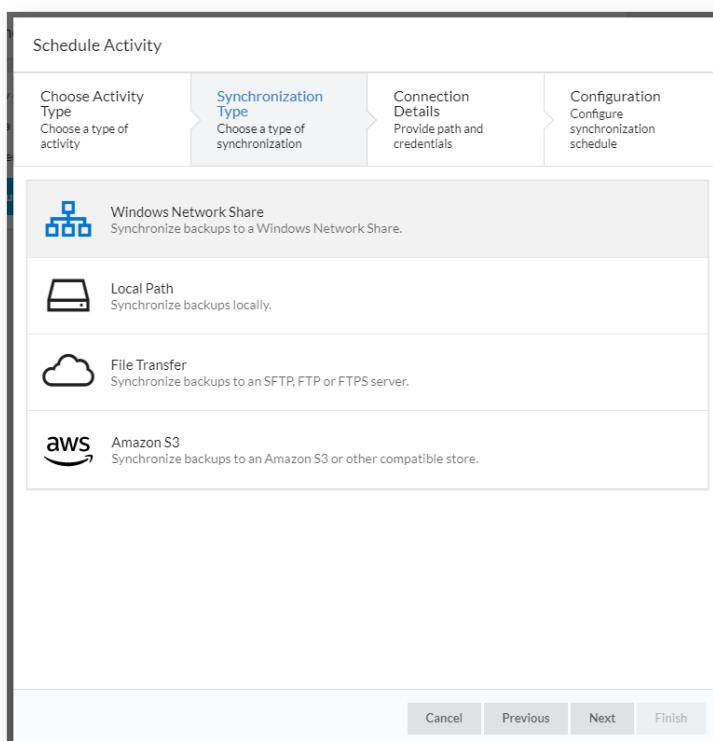

In the first stage, the type of activity and Repository are chosen. For Remote Synchronization, this should always be **Schedule Synchronization**. This stage may be skipped depending on how the wizard is launched.

# Macrium Site Manager User Guide

## Stage 2 - Synchronization Type

In the second stage of configuration, the type of remote sync is chosen. The types available are:

# Macrium Site Manager User Guide

Synchronization Type	Description
Windows Network Share	Synchronization to any remote server which can communicate as a SMB/CIFS share of the form \\servername\\share
Local Path	Synchronization with any file path local to the Site Manager server. This might be a folder, a local USB disk or any other path which can be read and written to as a folder
File Transfer	Synchronization to a server running SFTP, FTP or FTPS
Amazon S3	Synchronization to a Amazon S3 server or other compatible store

The next step will change depending on which synchronization type is chosen.

## Stage 3 - Connection Details

The third stage of configuration includes all the options specific to configuration type. This includes the path to the remote server or folder and any authentication details. The different remote synchronization types take the following details:

# Macrium Site Manager User Guide

# Macrium Site Manager User Guide

Synchronization Type	Available Options
<b>Windows Network Share</b>	Network share path in UNC format (\server\share\folder, backslash separated), username, password and domain. If a domain is entered as part of the username (in DOMAIN\User or user@domain.dns form), the domain field is disabled.
<b>Local Path</b>	Local path in Windows path format (Backslash separated) with optional username, password and domain. If these are omitted, the path is accessed using the SYSTEM account of the Site Manager server.
<b>File Transfer</b>	Type of protocol (FTP, FTPS or SFTP in the URI dropdown), Path to the server in URI format (sftp://example.com/home/backups/macrium, omitting the leading sftp:// and using forward slash separators), username and password for the remote server.  A custom port may also be supplied.
 <b>SFTP Paths</b>	<p>When configuring an SFTP server, include the full path to the folder to sync to in the server path, NOT the path relative to the user's home folder. For example, when connecting to a server as <b>user</b>, to sync to the user's home folder the full path must be specified e.g. <b>example.com/home/user/macrium</b> not <b>example.com/macrium</b></p> <p><b>This may not apply to all SFTP servers or to FTP servers.</b></p>
<b>Amazon S3</b>	<ul style="list-style-type: none"><li>• S3 Service - Amazon, Wasabi, Backblaze or Custom for full configuration control.</li><li>• Endpoint - URL per the service providers specification, required only for custom configurations, protocol type (Https or Http) with URL omitting the leading protocol type.</li><li>• Bucket - Active bucket as configured within the service providers console.</li><li>• Region - The selected buckets region identifier per service providers specification.</li><li>• Root Path - Location within the bucket to upload remote sync files to, should be forward slash separated.</li><li>• Authentication - Access key and secret key as configured within the service providers console.</li></ul> <p>Further information can be found in <a href="#">this article</a>.</p>

## Stage 4 - Configuration

The final stage configures options which apply to all synchronization types. The options are as follows:

# Macrium Site Manager User Guide

Schedule Activity

Choose Activity Type Choose a type of activity	Synchronization Type Choose a type of synchronization	Connection Details Provide path and credentials	Configuration Configure synchronization schedule
<p>Custom Name</p> <p>The custom name is provided for display purposes only and has no effect on the synchronization process.</p> <p>Folder Name *</p> <p>A folder with this name will be created on the synchronization share provided and contain all synchronized backup files. Multiple repositories can synchronize with the same share if they specify different folder names.</p> <p>Synchronization Window *</p> <p>00:00      00:00</p> <p>Frequency *</p> <p><input checked="" type="checkbox"/> Monday <input checked="" type="checkbox"/> Tuesday <input checked="" type="checkbox"/> Wednesday <input checked="" type="checkbox"/> Thursday <input checked="" type="checkbox"/> Friday <input checked="" type="checkbox"/> Saturday <input checked="" type="checkbox"/> Sunday</p> <p>Options</p> <p><input type="checkbox"/> Allow Backups During Remote Synchronization</p>			
<p>Cancel Previous Next <b>Finish</b></p>			

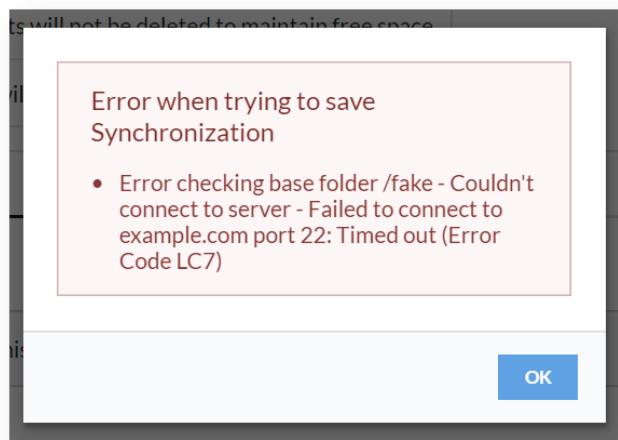

Option	Description
<b>Custom Name</b>	The custom name is shown in the UI to identify the sync. If left blank, the server/local path of the sync will be used instead
<b>Folder Name</b>	<p>The folder name set here will be created on the server/remote path to store the synchronized backups</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p><b>i</b> The path configured as part of the network or server path must exist on the remote server or the sync process will generate an error, however Site Manager will create the folder set as the <b>Folder Name</b> if it does not already exist.</p> <p>For example, if remote sync is configured with a server of <b>sftp://192.168.0.1/home/backups</b> and a folder name of <b>SiteManager1</b>, the sync process will store image files in <b>/home/backups/SiteManager1</b>, creating the <b>SiteManager1</b> folder if necessary.</p> <p>Multiple repositories can sync to the same server/network path so long as the folder name is different for each one.</p> </div>
<b>Synchronization Window - Times</b>	The synchronization window controls what time of day the sync will run. When the start time is reached, Site Manager will stop scheduling backups on the repository, wait for any existing backups to finish then run the sync. After the sync has finished, backups resume. If the sync

# Macrium Site Manager User Guide

Option	Description
	can't be started before the sync end time is reached, the sync attempt is abandoned until the following day. This option allows some control over when high internet bandwidth options like sync get run.
<b>Synchronization Window - Frequency</b>	The sync process can be limited to only happening on some days of the week by selecting the desired days here.
<b>Options - Allow Backups During Remote Sync</b>	<p>If this option is selected, backups to the repository will be allowed to continue during the synchronization process, with some limitations.</p> <ol style="list-style-type: none"><li>1. The remote sync can only start when no backups are running - this is so that there is a consistent, point in time view of which backups exist</li><li>2. The sync process will find changes and data to upload and sort them by computer</li><li>3. Changes are uploaded for the computer with the smallest amount of data to upload</li><li>4. The computer from step 3 is 'unlocked' and backups for this computer may now start</li><li>5. Steps 3 and 4 are repeated until all data is uploaded</li><li>6. The change is committed in the remote location. Before this step, if the sync fails, the changes can be rolled back to the previous repository state</li></ol>

## Finishing the Wizard

When finishing the wizard, a connection test is performed by the server and any errors are highlighted to be fixed:

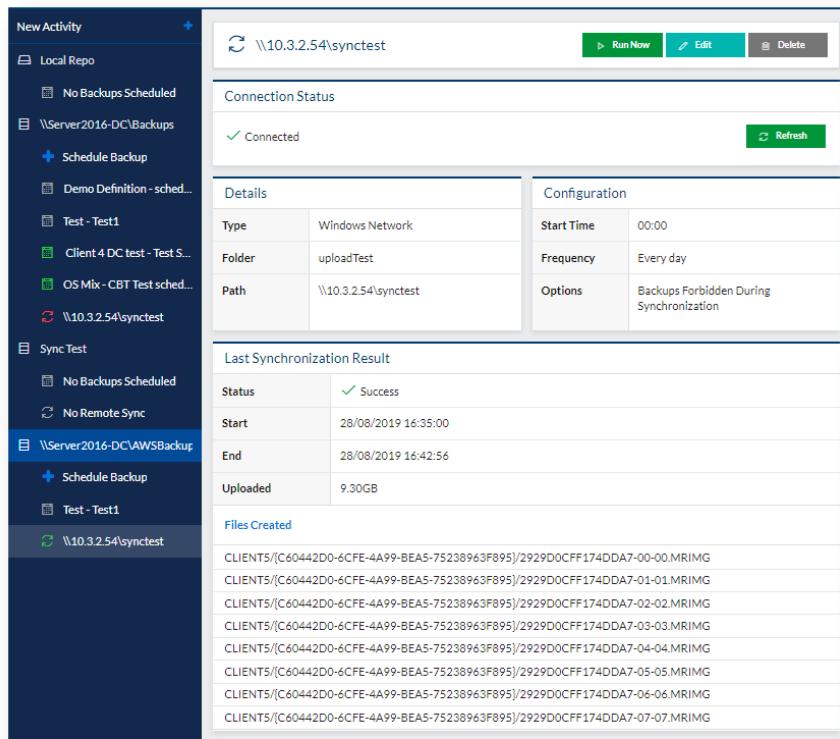

# Macrium Site Manager User Guide

## Viewing Remote Synchronization Status

### Current Server Status

Once Remote Synchronization has been configured, the Remote Synchronization activity in the **Scheduled Activity** page will display the following status:

The screenshot shows the 'Scheduled Activity' page with the following details:

- Activity List:** Local Repo, \\Server2016-DC\Backups, Demo Definition - sched..., Test - Test1, Client 4 DC test - Test S..., OS Mix - CBT Test sched..., \\10.3.2.54\synctest, Sync Test, No Backups Scheduled, No Remote Sync, \\Server2016-DC\AWSBackup, Schedule Backup, Test - Test1, \\10.3.2.54\synctest.
- Selected Activity:** \\10.3.2.54\synctest (highlighted in blue).
- Connection Status:** Connected (green checkmark).
- Details:**

Type	Windows Network
Folder	uploadTest
Path	\\10.3.2.54\synctest
- Configuration:**

Start Time	00:00
Frequency	Every day
Options	Backups Forbidden During Synchronization
- Last Synchronization Result:**

Status	Success (green checkmark)
Start	28/08/2019 16:35:00
End	28/08/2019 16:42:56
Uploaded	9.30GB

The **Run Now** option allows a sync to be started manually. This manually started sync will wait for any active backups in the Repository to finish before starting and will prevent any backups from starting until the sync is completed.

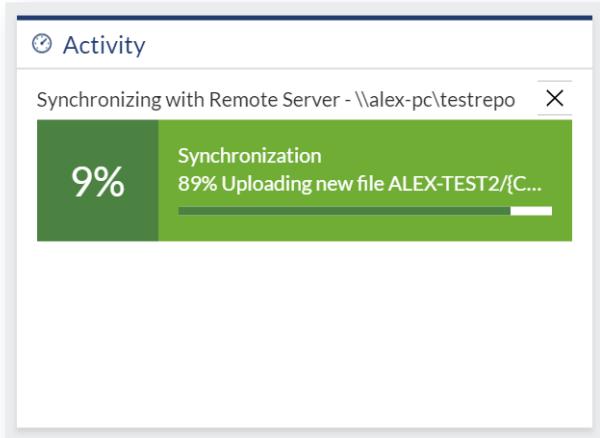

### Last Synchronization Results

This section shows the results of the last sync which ran, including whether it succeeded, any error messages, the amount of data uploaded and which files were affected.

### Viewing a Synchronization in Progress

Upcoming syncs are shown in the forecast of the Repository and active syncs are shown in the Activity widget on the Dashboard page just as for backups

# Macrium Site Manager User Guide

## Common Issues and Fixes

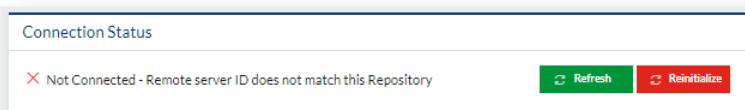

### Synchronization Failures

If a sync fails part way through the upload process, the next sync will roll the remote server back to its previous state before starting - there is no need to do anything to repair the remote sync repository state, this will happen automatically on the next sync. Communications issues are handled by internally retrying the upload for up to 10 minutes if a disconnection from the server happens.

### Full Backup Files are Synchronized When Creating Incremental Backups

The remote synchronization process uploads any new or changed backups. As this works at a file level, a change to a full backup caused by the ***Create Synthetic Fulls*** option in the a backup schedule will cause the full image file to be re-uploaded. It is recommended to avoid this option if the amount of data uploaded is a problem.

### Remote Server ID mismatch

# Macrium Site Manager User Guide

Last Synchronization Result	
Status	<span style="color: red;">✗</span> Failed
Error	Remote server ID does not match this repository
Start	14:41:28
End	14:41:29
Uploaded	0B
No files have been updated or created	

Sometimes a remote sync connection or sync attempt will fail the error **Remote server ID does not match this repository**. This error means that the local repository's unique ID does not match the one recorded on the server for this sync. This can have many causes:

- **An error on the Repository** - If the ID file is deleted from the repository, a new ID will be generated. If this happens the remote sync is stopped to prevent local repository data with errors from overwriting the remote copy
- **Multiple Repositories syncing to the same server** - if multiple repositories sync to the same server and path, the one which connects first and writes their unique ID file to the server will own it and sync to it. The other repository will generate an error instead. This prevents multiple repositories from overwriting each others data.
- **Server space is being reused for a different Repository** - If a Site Manager server is moved or the remote sync destination has old Site Manager sync data, there may be an ID error generated because the remote sync server still has the ID from the old Repository.

If the ID mismatch has been caused by old data or is otherwise not relevant, the Repository can write a new ID file to the remote server and take it over by using the **Reinitialize** option. This will update the ID file and allow the remote sync to proceed.

## Remote Synchronization with Amazon S3 or Other Compatible Stores

- Overview
- S3 Store Configuration
  - Buckets
  - Regions
- Authorisation
  - IAM
  - Policies
- Service Billing

# Macrium Site Manager User Guide

## Overview

Site Manager can automatically synchronize all backups stored in a Repository to Amazon S3 or other compatible stores like Wasabi or Backblaze. This article covers key aspects specific to S3 that should be understood and managed before remote synchronization with S3 can operate. For an overview of remote synchronization and how to configure it (including S3 configuration) see [this article](#).

## S3 Store Configuration

### Buckets

A bucket is the first layer of storing file objects within an S3 store, it must be created and configured before attempting to connect Site Manager to S3. This can generally be done in the S3 service providers user console. Some of the possible options include region selection, object versioning/retention policies and storage encryption.

### Regions

Regions select the specific servers that will be used to store the file objects and are entirely subjective to the user.

### Authorisation

### IAM

IAM users and groups are a fundamental part of Amazon S3 that can be used to produce managed access to an S3 bucket, the IAM user assigned to remote synchronization must have a valid access key and secret key to establish a connection with Site Manager. Other compatible stores may not use the same exact key terms, but should provide a similar interface to acquire the access key and secret key to the user account.

### Policies

Policies are another fundamental part of Amazon S3 that allow specific S3 actions to be bundled together and applied to an IAM user/group account. Other compatible stores may not use the same exact key terms and in most cases the service provider will have similar policy options, but some may be limited with this level of policy selection. The minimum required policy actions for remote synchronization to operate with S3 are included below:

Category	Permission
List	ListAllMyBuckets, ListBucket, ListBucketMultipartUploads, ListBucketVersions and ListMultipartUploadParts
Read	GetObject
Write	AbortMultipartUpload, DeleteObject, DeleteObjectVersion and PutObject

 DeleteObjectVersion is optional if bucket versioning is **not** used

# Macrium Site Manager User Guide

Amazon S3 Example:

Action (10 of 128) <a href="#">Show remaining 118</a>
<a href="#">List (5 of 10 actions)</a>
<a href="#">ListAllMyBuckets</a>
<a href="#">ListBucket</a>
<a href="#">ListBucketMultipartUploads</a>
<a href="#">ListBucketVersions</a>
<a href="#">ListMultipartUploadParts</a>
<a href="#">Read (1 of 52 actions)</a>
<a href="#">GetObject</a>
<a href="#">Write (4 of 41 actions)</a>
<a href="#">AbortMultipartUpload</a>
<a href="#">DeleteObject</a>
<a href="#">DeleteObjectVersion</a>
<a href="#">PutObject</a>

## Service Billing

S3 object storage services generally incorporate a billing policy based on various forms of usage like disk space, transfers, server-side operations and deletion to name but a few. Billing policies vary greatly between different service providers and should be closely reviewed to avoid unexpected costs from your selected provider.

Where possible, remote synchronisation to an S3 store will be performed in an as efficient manner as possible, but due to some necessary remote synchronization procedures, temporary objects and temporary server-side object duplication is often required and may result in additional charges depending on the service providers billing policies.

## Monitoring and Management Tools

Macrium Site Manager contains a number of tools for monitoring and managing a backup deployment on an ongoing basis. These tools, with notes on how to use and interpret the data provided are documented here. Available tools are:

- [Backup Logs](#) - Detailed logs from all backups of Site Manager are collated in Site Manager so any backups can be examined in detail and any failures diagnosed.
- [Event Logs](#) - Actions in Site Manager are logged in an event log so that they can be audited and reviewed.

# Macrium Site Manager User Guide

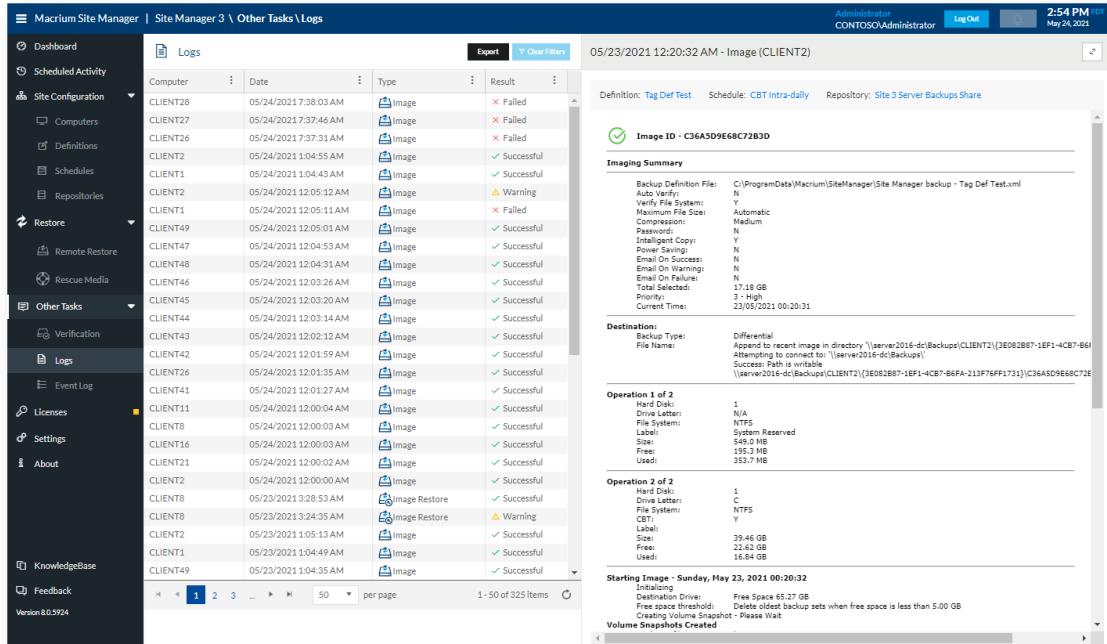

## Reviewing Backup Logs

All remote backup logs are stored centrally for review. To access the logs, follow these steps:

### Viewing Backup Logs

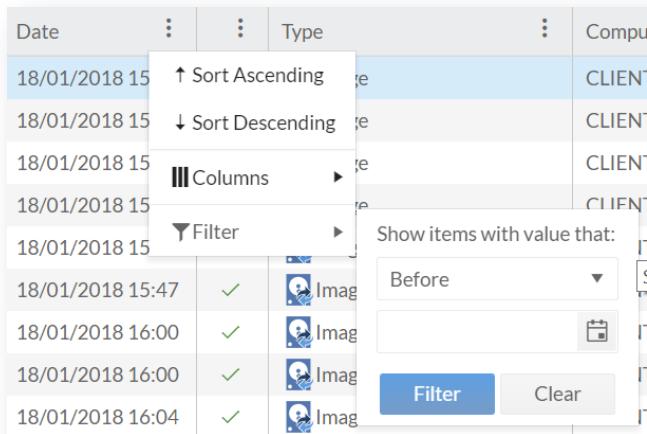

Click 'View Logs' under 'Other Tasks' on the main console view.

The log view can be sorted by clicking the column headings in the log list.

The screenshot shows the Macrium Site Manager interface with the 'Logs' view selected under 'Other Tasks'. The left sidebar includes 'Dashboard', 'Scheduled Activity', 'Site Configuration' (Computers, Definitions, Schedules, Repositories), 'Restore' (Remote Restore, Rescue Media), 'Other Tasks' (Verification, Logs, Event Log), 'Licenses', 'Settings', 'About', and 'KnowledgeBase'. The 'Logs' view displays a table of backup logs with columns: Computer, Date, Type, and Result. The table shows logs for various clients (CLIENT28 to CLIENT49) from May 24, 2021, with results ranging from Failed to Successful. The right panel provides detailed logs for a specific entry, including backup definition, schedule, and repository details, as well as imaging summary, destination, and operation details. The interface is dated May 24, 2021, at 2:54 PM.

The columns can also be filtered by selecting the dropdown menu on the column selecting the appropriate filter option.

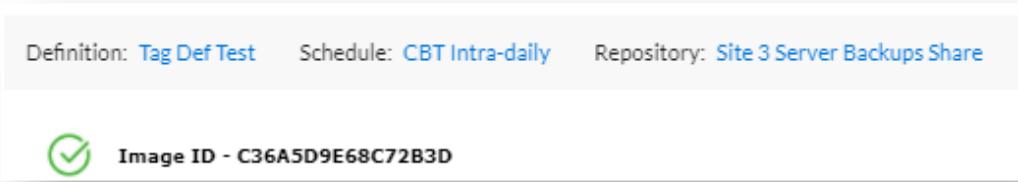

The screenshot shows the 'Logs' table with a filter dropdown open for the 'Type' column. The dropdown menu includes 'Sort Ascending', 'Sort Descending', 'Columns', and 'Filter'. The 'Filter' option is selected, showing a sub-menu with a search field 'Show items with value that:' and a dropdown 'Before' with a calendar icon. The table lists backup logs for various clients on January 18, 2018, with the 'Type' column showing 'Image' for all entries.

# Macrium Site Manager User Guide

The 'Date' column can be filtered by logs either before, on or after a given date. Other columns can be filtered by matching computer names or have a selection of types to include in the list.

Filters can be reset using the **Clear Filters** button at the top of the page.

To view a log, click on the row in the table and the log will be loaded into the right hand side of the screen. There is also an expansion button in the top right of the log view for maximizing the log. If the log is from a Site Manager scheduled backup, there will be links to the appropriate definition, schedule and repository at the top of the log:

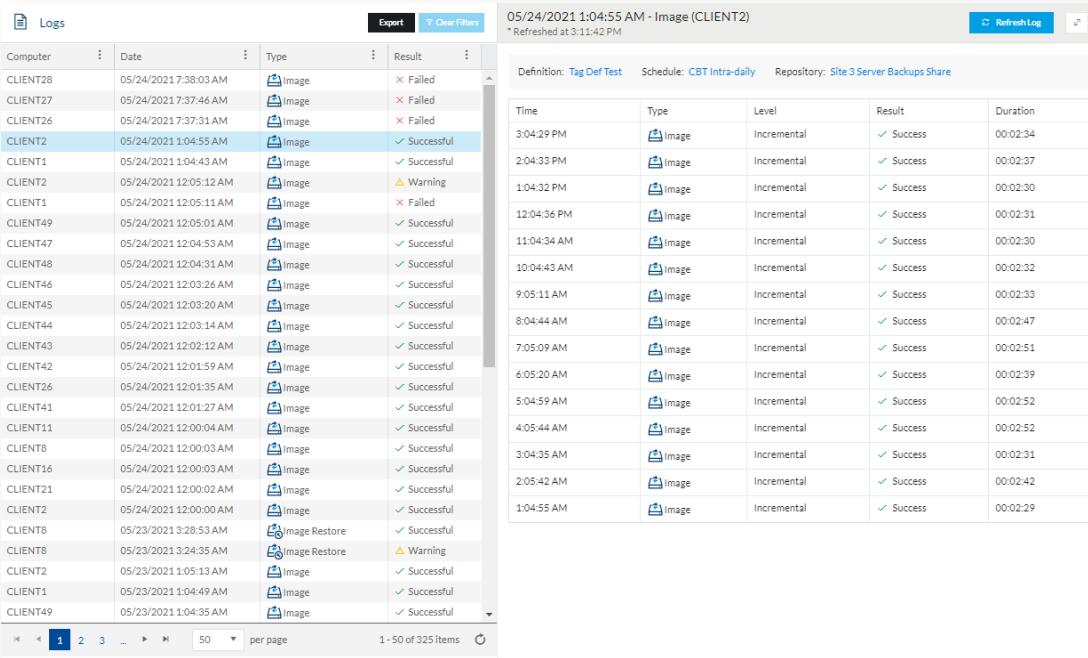

The screenshot shows a log entry for 'Image ID - C36A5D9E68C72B3D'. At the top, there are filters for 'Definition: Tag Def Test', 'Schedule: CBT Intra-daily', and 'Repository: Site 3 Server Backups Share'. The log entry itself has a green checkmark icon and the text 'Image ID - C36A5D9E68C72B3D'.

Note that these links may not be present if the Definition, Schedule or Repository has been deleted from Site Manager since the backup occurred.

## Intra-Daily Backups

When scheduled backups are taken with an Intra-daily schedule which has the **Intra-daily Stealth** option set, normal logs are not created except in cases of backup error or warning. Instead, each computer has an intra-daily log for the day, with the backup times and results for that day. Each Computer and Backup Definition pair will be in a separate daily log.

The screenshot shows the 'Logs' interface. On the left is a table of logs with columns: Computer, Date, Type, and Result. A specific log for 'CLIENT2' on 05/24/2021 is selected, showing a detailed log view on the right. The detailed log view shows a table with columns: Time, Type, Level, Result, and Duration. The log details 16 backup events for 'CLIENT2' on 05/24/2021, all of which were successful (green checkmarks). The log view also includes navigation buttons for pages 1-50 of 325 items.

# Macrium Site Manager User Guide

## Exporting Backup Logs

Backup log information may be exported in CSV format in order to help analysis and auditing tools. Clicking the **Export** button will download a CSV file in the browser containing the information from the log list. This data can be imported into any tool which can work with CSV data, such as Excel.

# Reviewing Event Logs

All actions which have been taken by Site Manager or by users in the console are logged in the Event Log. This allows administrators to review activity for auditing, security or reporting purposes.

## Viewing Event Logs

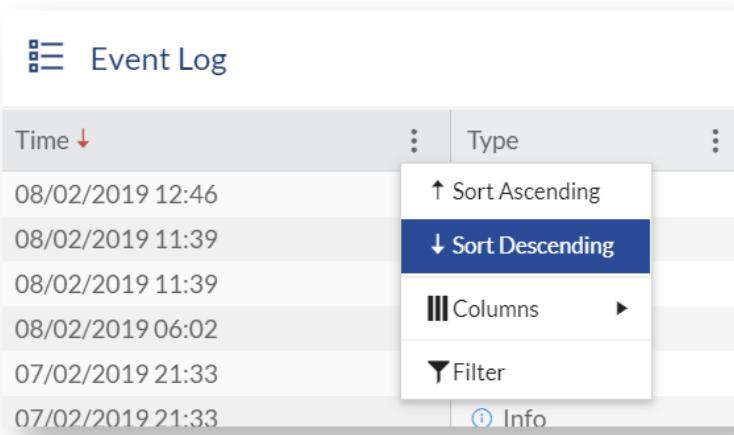

To view the event logs, follow the steps below:

Click 'View Event Logs' under 'Other Tasks' on the main Site Manager interface. The Event Log page will be shown as below:

Event Log									Actions	
Time	Type	Source	Event	Computer	User	Message				
05/24/2021 4:08:27 PM	Info	Scheduler	Backup Finished	CLIENT48		Backup (Image) completed on CLIENT48 - log file, status Successful				
05/24/2021 4:07:20 PM	Info	Scheduler	Backup Finished	CLIENT2		Backup (Image) completed on CLIENT2 - log file, status Successful				
05/24/2021 4:07:12 PM	Info	Scheduler	Backup Finished	CLIENT1		Backup (Image) completed on CLIENT1 - log file, status Successful				
05/24/2021 4:06:06 PM	Info	Scheduler	Backup Finished	CLIENT47		Backup (Image) completed on CLIENT47 - log file, status Successful				
05/24/2021 4:05:39 PM	Info	Scheduler	Backup Finished	CLIENT49		Backup (Image) completed on CLIENT49 - log file, status Successful				
05/24/2021 4:04:33 PM	Info	Scheduler	Backup Started	CLIENT2		Backup (Image) started on CLIENT2				
05/24/2021 4:04:31 PM	Info	Scheduler	Scheduled Backup Triggered	CLIENT2		Attempting scheduled Differential backup of CLIENT2 on Site 3 Server Backups				
05/24/2021 4:04:31 PM	Info	Scheduler	Backup Finished	CLIENT44		Backup (Image) completed on CLIENT44 - log file, status Successful				
05/24/2021 4:04:23 PM	Info	Scheduler	Backup Started	CLIENT1		Backup (Image) started on CLIENT1				
05/24/2021 4:04:22 PM	Info	Scheduler	Backup Started	CLIENT49		Backup (Image) started on CLIENT49				
05/24/2021 4:04:22 PM	Info	Scheduler	Scheduled Backup Triggered	CLIENT1		Attempting scheduled Differential backup of CLIENT1 on Site 3 Server Backups				
05/24/2021 4:04:22 PM	Info	Scheduler	Backup Finished	CLIENT46		Backup (Image) completed on CLIENT46 - log file, status Successful				
05/24/2021 4:04:22 PM	Info	Scheduler	Scheduled Backup Triggered	CLIENT49		Attempting scheduled Differential backup of CLIENT49 on Site 3 Server Backups				
05/24/2021 4:04:22 PM	Info	Scheduler	Backup Finished	CLIENT43		Backup (Image) completed on CLIENT43 - log file, status Successful				
05/24/2021 4:04:21 PM	Info	Scheduler	Backup Started	CLIENT48		Backup (Image) started on CLIENT48				
05/24/2021 4:04:20 PM	Info	Scheduler	Scheduled Backup Triggered	CLIENT48		Attempting scheduled Differential backup of CLIENT48 on Site 3 Server Backups				
05/24/2021 4:04:20 PM	Info	Scheduler	Backup Finished	CLIENT41		Backup (Image) completed on CLIENT41 - log file, status Successful				
05/24/2021 4:04:13 PM	Info	Scheduler	Backup Started	CLIENT47		Backup (Image) started on CLIENT47				
05/24/2021 4:04:12 PM	Info	Scheduler	Scheduled Backup Triggered	CLIENT47		Attempting scheduled Differential backup of CLIENT47 on Site 3 Server Backups				
05/24/2021 4:04:12 PM	Info	Scheduler	Backup Finished	CLIENT45		Backup (Image) completed on CLIENT45 - log file, status Successful				
05/24/2021 4:02:53 PM	Info	Scheduler	Backup Started	CLIENT46		Backup (Image) started on CLIENT46				
05/24/2021 4:02:52 PM	Info	Scheduler	Backup Started	CLIENT45		Backup (Image) started on CLIENT45				
05/24/2021 4:02:52 PM	Info	Scheduler	Scheduled Backup Triggered	CLIENT46		Attempting scheduled Differential backup of CLIENT46 on Site 3 Server Backups				
05/24/2021 4:02:52 PM	Info	Scheduler	Backup Finished	CLIENT42		Backup (Image) completed on CLIENT42 - log file, status Successful				
05/24/2021 4:02:51 PM	Info	Scheduler	Scheduled Backup Triggered	CLIENT45		Attempting scheduled Differential backup of CLIENT45 on Site 3 Server Backups				
05/24/2021 4:02:51 PM	Info	Scheduler	Backup Finished	CLIENT2		Backup (Image) completed on CLIENT2 - log file, status Successful				
05/24/2021 4:02:49 PM	Info	Scheduler	Backup Started	CLIENT44		Backup (Image) started on CLIENT44				
05/24/2021 4:02:48 PM	Info	Scheduler	Scheduled Backup Triggered	CLIENT44		Attempting scheduled Differential backup of CLIENT44 on Site 3 Server Backups				
05/24/2021 4:02:48 PM	Info	Scheduler	Backup Finished	CLIENT26		Backup (Image) completed on CLIENT26 - log file, status Successful				
05/24/2021 4:01:32 PM	Info	Scheduler	Backup Started	CLIENT43		Backup (Image) started on CLIENT43				
05/24/2021 4:01:31 PM	Info	Scheduler	Scheduled Backup Triggered	CLIENT43		Attempting scheduled Differential backup of CLIENT43 on Site 3 Server Backups				
05/24/2021 4:01:30 PM	Info	Scheduler	Backup Finished	CLIENT16		Backup (Image) completed on CLIENT16 - log file, status Successful				
05/24/2021 4:01:35 PM	Info	Scheduler	Backup Started	CLIENT42		Backup (Image) started on CLIENT42				
05/24/2021 4:01:34 PM	Info	Scheduler	Scheduled Backup Triggered	CLIENT42		Attempting scheduled Differential backup of CLIENT42 on Site 3 Server Backups				
05/24/2021 4:01:34 PM	Info	Scheduler	Backup Finished	CLIENT11		Backup (Image) completed on CLIENT11 - log file, status Successful				
05/24/2021 4:01:27 PM	Info	Scheduler	Backup Started	CLIENT41		Backup (Image) started on CLIENT41				
05/24/2021 4:01:26 PM	Info	Scheduler	Scheduled Backup Triggered	CLIENT41		Attempting scheduled Differential backup of CLIENT41 on Site 3 Server Backups				

To sort the event log, click on column heading you want to sort by (multiple clicks will cycle through ascending, descending and unsorted) or click the dropdown menu on the right hand side of a column heading and select the appropriate sort option.

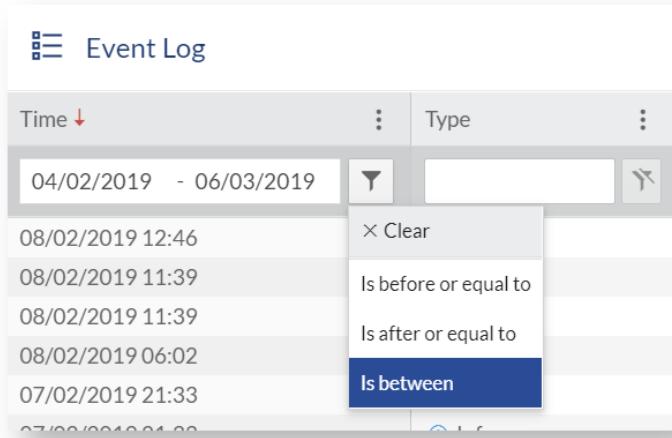

# Macrium Site Manager User Guide

A screenshot of a table titled 'Event Log'. The table has two columns: 'Time' and 'Type'. The 'Time' column is sorted in descending order. A context menu is open over the 'Time' column, with the 'Sort Descending' option highlighted. Other options in the menu include 'Sort Ascending', 'Columns', 'Filter', and 'Info'.

Time ↓	Type
08/02/2019 12:46	
08/02/2019 11:39	
08/02/2019 11:39	
08/02/2019 06:02	
07/02/2019 21:33	
07/02/2019 21:33	

To filter, select any column heading and click **Filter**. This will display the filter bar below the headings:

A screenshot of the same 'Event Log' table. The 'Time' column is selected, and a context menu is open, with the 'Filter' option highlighted. The filter bar below the table shows a date range from '04/02/2019 - 06/03/2019'. The 'Time' column is currently set to 'Is between'.

Time ↓	Type
04/02/2019 - 06/03/2019	
08/02/2019 12:46	
08/02/2019 11:39	
08/02/2019 11:39	
08/02/2019 06:02	
07/02/2019 21:33	
07/02/2019 21:33	

To apply a filter, click the edit box under the column to be filtered and select the appropriate option. The filter button to the right of the edit box allows clearing the filter or selecting between different filter types where available.

## Event Log Columns

The Event Log table has columns as follows:

Column Name	Description
Time	The date and time when the event was logged.
Type	The 'Type' column indicates the severity of the event. The types are: <ul style="list-style-type: none"><li>Info - A normal event in the operation of the Management Console</li><li>Warning - Something unusual which may indicate a problem or unusual operation</li></ul>

# Macrium Site Manager User Guide

Column Name	Description
	<ul style="list-style-type: none"><li>• Error - A failure of some sort which may require investigation</li></ul>
Source	There are a number of different sources for each event. These sources show which part of the system the event originated from and filtering on source may be useful to show related events from the same area
Event	The event which has occurred. A full list is available below
Computer	If the event is associated with a computer, the NetBIOS name of the computer will be shown here.
User	If the event was initiated by a user, the user's login name will be shown here.
Message	This contains the message detail for the event. The message can vary depending on whether the event is a success or failure event. For example, a 'Backup End' event may show additional error information for a failed backup over a successful one.

## Event Log Sources

The available Event Log sources are listed below:

Event Log Source Name	Description
System	Events from the server which is running Site Manager such as startup and shutdown events from the Windows service running Site Manager.
Logon	Events relating to user login/logout of sessions
Settings	Changes to any of the items in Site Manager settings
Update	Notifications of new Site Manager software versions
Licenses	Upgrade, Addition and removal of Macrium Agent License keys, warnings for problems with client licensing
Computers	Additional and removal of managed computers, online/offline status notifications
Backup Definitions	Changes to Backup Definitions

# Macrium Site Manager User Guide

Event Log Source Name	Description
Schedules	Changes to Schedules
Repository	Changes to Repositories
Scheduler	Events from the internal scheduling of backups by repositories including backup scheduling, start and end.
Reflect	Backup and restore events initiated from an individual computer's installation of Macrium Reflect rather than centrally
Dashboard	Events triggered from user interaction with the Dashboard page
Restore	Events from Site Manager triggered restore operations
Agent	Errors and notifications from Agents running on managed computers
Backup	Events from Site Manager triggered backup operations
Verification	Events from Site Manager triggered verification operations
Image File Browser	Events triggered by browsing image files in the repository page
Rescue	Events relating to Rescue Media generation

## Event Log Events

The list of possible events and useful information that may be logged is shown below. Note that if relevant, all events will contain a username and/or computer NetBIOS:

Event Log Event	Description	Data available
Startup	The Site Manager service has started up	Site Manager version
Shutdown	The Site Manager service has been requested to stop	
User Login	A user has logged in.	

# Macrium Site Manager User Guide

Event Log Event	Description	Data available
		Username, IP address
User Logout	A user has logged out	Username
Security Settings Changed	The security settings were changed by a user	
Slack Settings Changed	The Slack settings were changed by a user	
Notification Settings Changed	The Notification settings were changed by a user	
Update Available	An update to the Management console is available	New Software Version
Update Installed	The Site Manager has started with a new version	Old and new software version numbers
License Key Added	A License Key has been added as a Client Access License	License key and number of seats
License Key Removed	A License Key has been removed	License key
Unlicensed Computers	One or more computers cannot be accessed by Site Manager due to licensing issues	Number of affected computers
Computer Added	A computer has been added to Site Manager	Computer NetBIOS
Computer Removed	A computer has been removed from Site Manager	Computer NetBIOS
Agent Remotely Installed	Site Manager has attempted remote installation of an Agent	

# Macrium Site Manager User Guide

Event Log Event	Description	Data available
		Computer NetBIOS affected, install success, error messages
Agent Patched	The automatic Agent patching has pushed a patch to a remote Agent	Computer NetBIOS, patch name
Repeat Last Backup	The Repeat Last Backup function has been used to trigger a backup	Computer NetBIOS
Set Passphrase	The Passphrase for a computer has been changed on the server	Computer NetBIOS, passphrase
Agent Updated	A remote Agent is now running a new version of the Agent software	Old and new versions
Backup Definition Created	A new Backup Definition was created	Backup Definition name
Backup Definition Removed	A Backup Definition was removed	Backup Definition name
Backup Definition Updated	A Backup Definition was edited and updated	Backup Definition name
Schedule Created	A new Schedule was created	Schedule name
Schedule Removed	A Schedule was removed	Schedule name
Schedule Updated	A Schedule was edited and updated	Schedule name
Repository Created	A new Repository was created	Repository path

# Macrium Site Manager User Guide

Event Log Event	Description	Data available
Repository Removed	A Repository was removed	Repository path
Repository Updated	A Repository was edited and updated	Repository path
Repository Offline	The server lost contact with a Repository	Repository path
Scheduled Backup Added	Backups have been scheduled in a Repository	Repository path, Backup Definition name, Schedule name
Scheduled Backup Removed	Scheduled backups have been removed from a Repository	Repository path, Backup Definition name, Schedule name
Scheduled Backup Active	A scheduled backup has been set as active on a Repository	Repository path, Backup Definition name, Schedule name
Scheduled Backup Stopped	A scheduled backup has been stopped on a Repository	Repository path, Backup Definition name, Schedule name
Scheduled Backup Triggered	Scheduled backups have triggered a backup to start on a managed computer	Computer NetBIOS, Repository path, Backup Definition name, Schedule name
Backup Started	A backup has started or failed to start on a managed computer	Computer NetBIOS, error information
Backup Finished	A backup has finished or failed on a managed computer	Computer NetBIOS, error information, log file name

# Macrium Site Manager User Guide

Event Log Event	Description	Data available
Restore Started	A restore has started or failed to start on a managed computer	Computer NetBIOS, error information
Restore Finished	A restore has finished or failed on a managed computer	Computer NetBIOS, error information, log file name
Clone Started	A clone operation has started or failed to start on a managed computer	Computer NetBIOS, error information
Clone Finished	A clone operation has finished or failed on a managed computer	Computer NetBIOS, error information, log file name
Backup Paused	A backup has been paused from the Site Manager interface	Computer NetBIOS
Backup Cancelled	A backup has been cancelled from the Site Manager interface	Computer NetBIOS
Session Start	A web session to Site Manager has been started	IP Address
Session End	A web session to Site Manager has closed.  <div style="border: 1px solid #ccc; padding: 10px; width: fit-content; margin: auto;"><p> The session will be closed by the server some time after the user has closed their web browser. This can be up to 10 minutes</p></div>	
Restore Requested	A restore operation has been requested through Site Manager	Computer NetBIOS, image file name
Message Response	A request to an Agent has failed.	Computer NetBIOS, message type, error
Agent Status Changed	A managed computer has changed online status	Computer NetBIOS, Online or offline
Backup Requested	A backup operation has been requested through Site Manager	Computer NetBIOS

# Macrium Site Manager User Guide

Event Log Event	Description	Data available
Verification Started	A backup file verification operation has started	Backup file name and path
Verification Finished	A backup file verification operation has finished	Backup file name and path, success, error
Home Edition Agent Limit Reached	The number of Home Edition standalone licensed clients has exceeded the limit (4).	Number of Home Edition clients, whether excess clients are using MALs
Email Settings Changed	The Email settings were changed by a user	
System Settings Changed	The System settings were changed by a user	
Agent Settings Changed	Agent section of the settings page has been changed	
Rescue Media Settings Changed	The Rescue Media section of settings was changed by a user	
Network Settings Changed	The Network section of settings was changed by a user	
Daily Export Settings Changed	The Daily Data Export section of settings was changed by a user	
Email Notification	An email notification has been sent or failed to send	Email recipient, authentication type, error
		Computer NetBIOS

# Macrium Site Manager User Guide

Event Log Event	Description	Data available
Agent Passphrase Remote Update	The secure passphrase on a remote agent has been updated. This occurs when advanced agent security is set in settings and an agent has been connected for the first time or the global passphrase has been set on the Site Manager server	
Remote Management Settings Changed	The Remote Management settings were changed by a user	
Macrium Agent License Key Upgraded	A MAL has been upgraded. This may occur when a version 6 key is upgraded to version 7 when added to Site Manager.	Old and new keys
Standalone Reflect License Key Upgraded	A client computer with a standalone Macrium Reflect install has had the Reflect license key upgraded by the Site Manager. This occurs when the user requests an upgrade from a Reflect version 6 to a Reflect version 7 key.	Computer NetBIOS, old and new license keys
File Downloaded	A file has been downloaded by opening an image file in the Repository browser and downloaded	Image file, Downloaded file
Remote Synchronization Started	A Repository has started to sync to a remote server	Repository, remote server
Remote Synchronization Completed	A Repository has completed a sync to a remote server	Repository, remote server, error if appropriate
Run Now Remote Synchronization Triggered	A user has requested that a manual remote synchronization should be started	Repository, remote server
Remote Synchronization Reinitialized	A user has reinitialized a remote server so that it can be used as a target for remote synchronization	Repository, remote server
	User has cancelled a running remote synchronization through the Site Manager user interface	Repository, remote server

# Macrium Site Manager User Guide

Event Log Event	Description	Data available
Remote Synchronization Cancelled		
Configuration Import	A configuration backup has been imported into Site Manager through the settings page <b>Load Configuration</b> option	
Event Log Cleared	The Event Log was cleared by a user	
Provider Deleted	A Login Provider has been deleted by a user	Provider name
Provider Created	A Login Provider has been created by a user	Provider name
Provider Configured	A Login Provider has been edited by a user	Provider name, success or failure
Permissions Modified	Login Provider permissions have been changed by a user	Provider name, success or failure
Agent Migration Start	A migration of an Agent from this Site Manager to another has started	Agent name, destination Site Manager details
Agent Migration End	A migration of an Agent from this Site Manager to another has completed	Agent name, success or failure
Server Connection Settings Changed	The network configuration of the Site Manager server connection has been changed	New configuration details
Agent Manual Upgrade	An Agent has been queued for upgrade by a user	Agent name
Backup Warning	A non-fatal warning about a backup has been generated	

# Macrium Site Manager User Guide

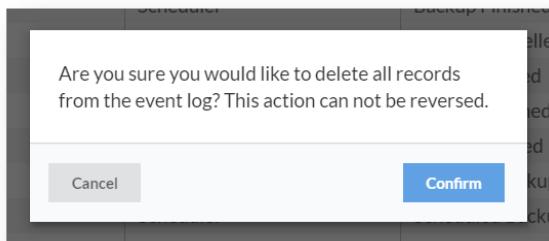

Event Log Event	Description	Data available
Rescue Media Build Started	A Rescue Media build has been started	Rescue Media type
Rescue Media Build Succeeded	A Rescue Media build has succeeded	Rescue Media type
Rescue Media Deleted	A Rescue Media image file was deleted	Rescue Media type
Rescue Media Build Cancelled	A Rescue Media build was cancelled	Rescue Media type
Purged Logs	Event Logs or Backup Logs have been purged due to age	Number of log entries purged
Restore Preparation Failed	An error happened while preparing for a remote restore - this can be related to the backup itself or the PE rescue environment	Error
Cancel Backup Request	A <b>Run Now</b> backup was cancelled from the forecast.	Computer, Definition and backup type
Permissions Granted	A user or group has been granted access to Site Manager	User or group name
Permissions Revoked	A user or group has had access revoked from Site Manager	User or group name
Configuration File Load Error	A Site Manager configuration file has failed to load. A copy has been made of the failed file for backup and support purposes	The file that failed to load

## Clearing the Event Log

To remove any unwanted log entries such as from early testing of a deployment before going live, the Event Log can be cleared. This will remove all entries. Once the Event Log has been cleared, a single **Event Log Cleared** event is logged.

To clear the Event Log, press the **Clear** button above the top right of the Event Log table:

# Macrium Site Manager User Guide

## Exporting the Event Log

The Event Log can be exported as a CSV file to allow analysis or archiving off the Site Manager Server. To export the Event Log, press the **Export** button above the top right of the Event Log table. A CSV will be downloaded which can be imported into other systems:

A	B	C	D	E	F
1	Event Time	Event Source	Event Type	Event	User
2	08/02/2019 12:46	Logon	Info	User Login	Administrator
3	08/02/2019 11:39	System	Info	Session End	Administrator
4	08/02/2019 11:39	Logon	Info	User Logout	Administrator
5	08/02/2019 06:02	System	Info	Session Start	
6	07/02/2019 21:33	System	Info	Session End	Administrator
7	07/02/2019 21:33	Logon	Info	User Logout	Administrator
8	07/02/2019 17:21	Scheduler	Info	Backup Finished	CLIENT1
9	07/02/2019 16:59	Scheduler	Info	Backup Started	CLIENT1
10	07/02/2019 16:59	Scheduler	Info	Run Now Backup Triggered	CLIENT1
11	07/02/2019 16:41	Computers	Info	Agent Status Changed	CLIENT1
12	07/02/2019 16:39	Computers	Info	Agent Status Changed	CLIENT1
13	07/02/2019 16:38	Scheduler	Warning	Backup Finished	CLIENT4
14	07/02/2019 16:38	Dashboard	Info	Backup Cancelled	Administrator
15	07/02/2019 16:38	Dashboard	Info	Backup Paused	Administrator
16	07/02/2019 16:22	Scheduler	Error	Backup Finished	CLIENT1

## Automatically Purging the Event Log

The Event Log can be configured to automatically purge any entries older than a specified number of days. This can be configured in the **System** section of **Settings** - see [Configuration and Security](#) for details.

Events will be deleted at midnight, with **Purged Logs** events being created when Event Logs or Backup Logs are purged.

## Managing and Restoring Backups

Once backups have been created and stored in a repository, Site Manager provides tools to manipulate these backups and restore them. The options available are:

- Restoring an Image through Site Manager - How to use the restore functionality of Site Manager to remotely restore an image
- Restoring an Image Through Macrium Reflect - How to open images in standalone Macrium Reflect or the Site Manager Agent and how to decode the repository file structure
- Verifying Images - How to verify the integrity of image files in a repository

# Macrium Site Manager User Guide

- [Synchronizing a Repository with a Remote Server](#) - How to set up automatic remote synchronization between a Site Manager Repository and a remote server
- [Creating Rescue Media](#) - How to create rescue media to be used in bare metal restore scenarios.

## Restoring an Image through Site Manager

- [Introduction](#)
- [Advanced Restores](#)
- [Restoring an Image using Site Manager](#)
  - [Selecting a Computer](#)
  - [Selecting an Image File to Restore](#)
  - [Selecting Restore Options](#)
  - [Reviewing the Restore and Finishing](#)
  - [Viewing a Restore Progress](#)

## Introduction

Site Manager allows image backups to be restored to the managed computer they were taken from without leaving the Site Manager interface. This process is designed for simple restore activity with the following features:

- Non system partitions will be restored without restarting the client computer.
- System partitions will be restored by restarting the client computer in Windows RE (if available) or Windows PE.  
**Note:** If required, the Windows PE Component files will first be automatically copied to the client PC and the recovery boot menu added. The restore will then automatically be continued in the PE rescue environment.
- Full progress of the restore is shown in the dashboard 'Activity' widget. This includes restorations running in Windows PE.
- A configurable restoration alert message dialog can optionally be shown on the client computer.
- Users logged on to the client computer can optionally cancel the restore operation.

## Advanced Restores

To restore a computer which is not online in Site Manager or requires options not available in the Site Manager restore, see the [Restoring an Image Through Macrium Reflect](#).

Site Manager will copy user-supplied drivers from the server to the target agent immediately before the restore so that the recovery environment supports agent hardware. Drivers to be copied should be placed in the Rescue Media Working Directory generic drivers folder appropriate for the operating system of the target agent. Use the table below to determine the right path:

Operating System of Target Agent	CPU Size	Subfolder Name
Windows Vista or later	64-bit	<b>PE10x64</b>

# Macrium Site Manager User Guide

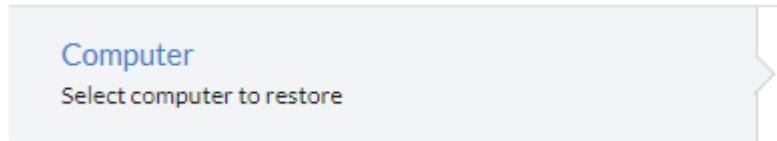

Operating System of Target Agent	CPU Size	Subfolder Name
Windows Vista or later	32-bit	<b>PE10x86</b>
Windows XP or Windows 7	64-bit	<b>PE3x64</b>
Windows XP or Windows 7	32-bit	<b>PE3x86</b>

For example, drivers to be used during restores of 64-bit Windows 10 machines should be placed in **workingDirectory\drivers\PE10x64** where **workingDirectory** is the Rescue Media Working Directory as specified in the Rescue Media settings. These folders will need to be created manually.

## Restoring an Image using Site Manager

The Site Manager restore process is a wizard driven process with a number of stages. These are:

### Selecting a Computer

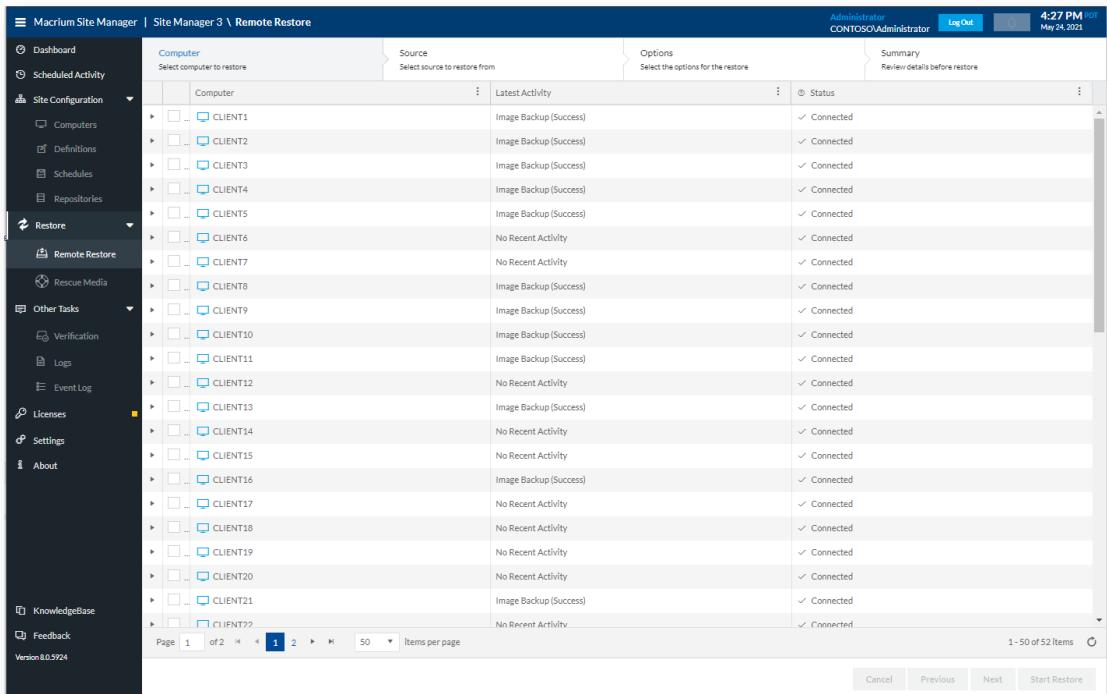

Select the 'Restore' side menu and select a computer to restore.

**Note:** Only one PC can be restored at a time

# Macrium Site Manager User Guide

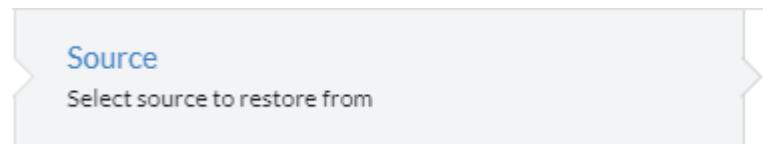

The screenshot shows the 'Remote Restore' section of the Macrium Site Manager interface. On the left, a navigation menu includes 'Dashboard', 'Scheduled Activity', 'Site Configuration' (with 'Computers', 'Definitions', 'Schedules', 'Repositories' sub-options), 'Restore' (selected), 'Remote Restore' (highlighted), 'Rescue Media', 'Other Tasks', 'Verification', 'Logs', 'Event Log', 'Licenses', 'Settings' (selected), 'About', 'KnowledgeBase', and 'Feedback'. The main area is titled 'Computer' and 'Source' with 'Options' and 'Summary' tabs. It lists 52 items, each with a checkbox, a computer name, a date, and a status (Connected or Not Connected). The 'Summary' tab is selected, showing 'Review details before restore'. At the bottom, there are page navigation buttons (Page 1 of 2), a '50' items per page dropdown, and 'Cancel', 'Previous', 'Next', and 'Start Restore' buttons.

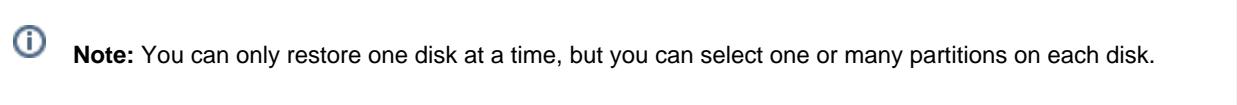

**Click 'Next'** to display a list of images found in repositories for the selected computer. Selecting an image file will display the Disk(s) and Partition(s) in the image file.

## Selecting an Image File to Restore

A screenshot of the 'Source' selection step in the restore process. It shows a 'Source' section with the sub-instruction 'Select source to restore from'. A large curly brace on the right side groups this section with the note below.

**Note:** You can only restore one disk at a time, but you can select one or many partitions on each disk.

Domain:

**Client Notifications**

Display message

Allow user to cancel

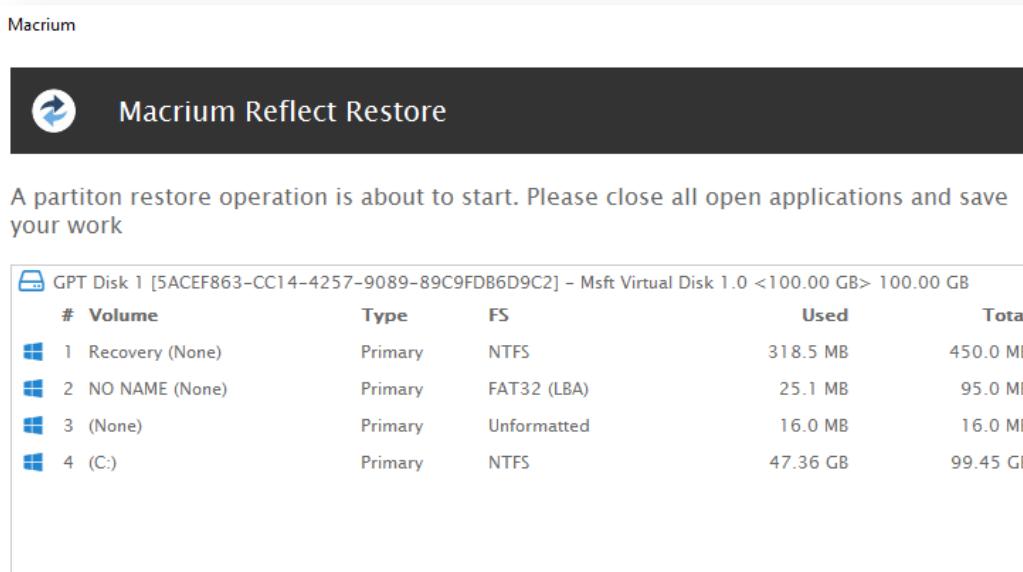

Message to display:

A partition restore operation is about to start. Please close all open applications and save your work

Time to display:  seconds

Option	Description
Rapid Delta restore	Only changed blocks are restored and the restore completes much faster with this option selected.
SSD TRIM	<p>Affects restore operations to SSD only.</p> <p>Reflect can flag all unused blocks using the TRIM operation. Writing to an unused block is much quicker as it avoids both the slow erase operation and the read-modify-write cycle. This results in increased lifetime and the performance of the device.</p> <p>It is effective for all Windows operating systems, even those that support SSD trim as the file system only tracks blocks on de-allocation; it cannot TRIM blocks written by another process. It is also effective for USB drives.</p>
Verify image before restore	<p>Perform a full image verification prior to starting the restore process. If any corruption is found in the image file then the restore will be aborted.</p> <p><b>Note:</b> Selecting this option will increase the restore time considerably.</p>
	Enter any authentication details to enable the computer being restored to access the image file network. The fields will be pre-populated with the authentication information saved in the repository configuration.

# Macrium Site Manager User Guide

Enter>Select the restore options and **click Next**

## Reviewing the Restore and Finishing

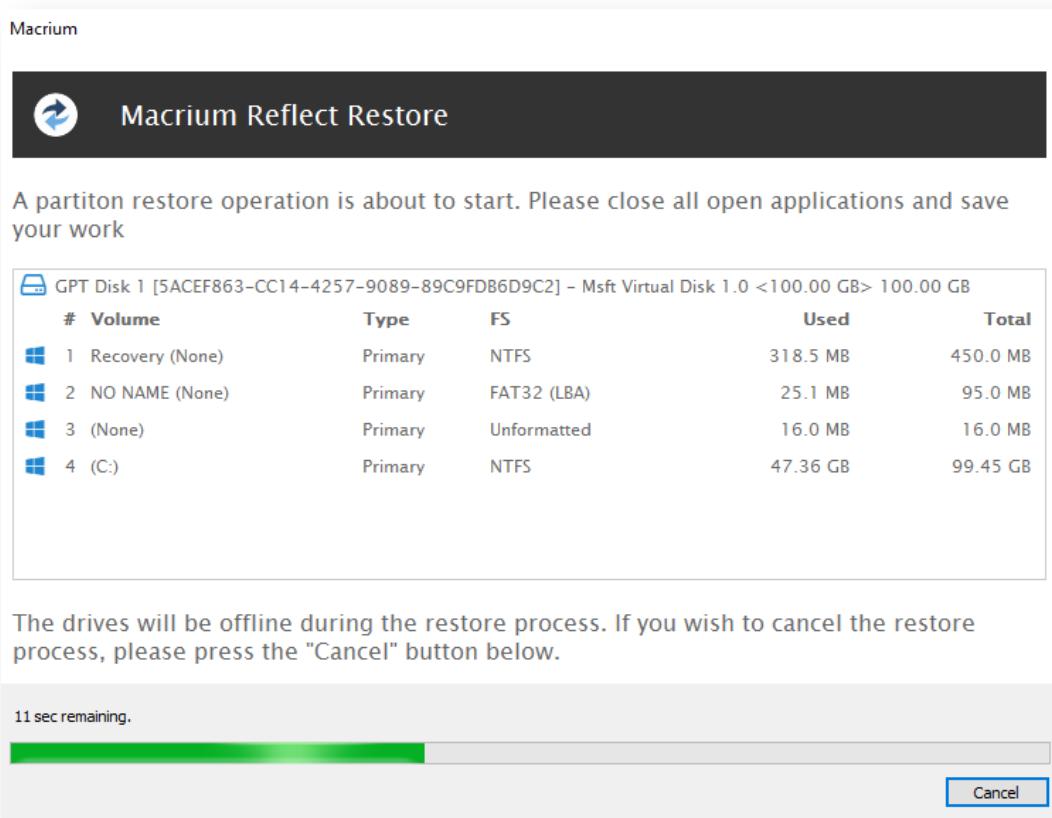

A summary of the restore selections and options is displayed. Confirm everything is OK and **click 'Start Restore'**

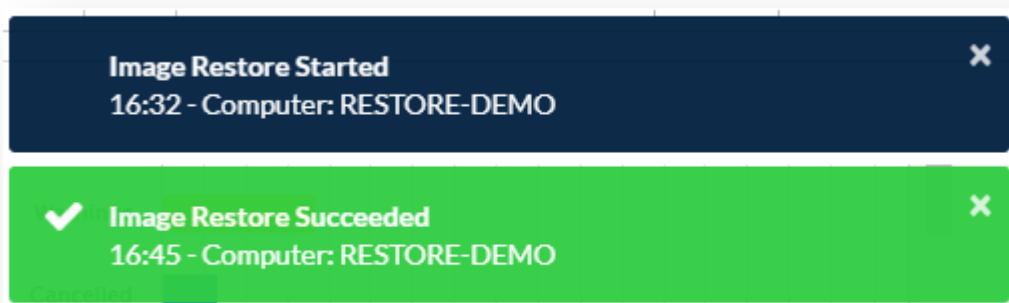

# Macrium Site Manager User Guide

## Viewing a Restore Progress

The Restore starts and a message dialog is displayed on the client computer (if the **Allow user to cancel** option has been selected)

In Site Manager, notifications indicate the success of the restore request and initialization.

The message countdown and restore can be monitored in the dashboard **Activity** widget.

## Manual Restore Options

A restore within Macrium Site Manager performs a simple restore of data in the image file with few advanced options. This is good for performing a quick restore, but if more complex restore operations are required, the image files created by Macrium Site Manager can be viewed and restored by either a standalone installation of Macrium Reflect or by the Macrium Agent itself.

Opening images in this way allows the following:

- Restore to dissimilar hardware
- Restore by rescue media
- Browsing image files for file-level access
- Creating VHD files or VMs

See [Macrium Reflect - Restoring and Browsing Images](#) for more details.

### Finding Images in a Repository

The repository folder structure is automatically created as needed. It follows this pattern:

```
<Repository root path>\<Computer name>\<Definition ID>\ImageFile.mrimg
```

Where **Computer Name** is the NetBIOS name of a computer in Site Manager and **Definition ID** is an ID number corresponding to a Backup Definition. Inside that folder are image files. All image files created for a computer using a backup definition go in the same folder, even if they were performed with a different schedule or using a **Run Now** backup.

To translate the backup definition ID into a backup definition name, the Site Manager creates an information file in the top level of the repository. This file is called **Macrium Repository Information.txt**

```
Macrium Repository - v1
This file lists folder names associated with Backup Definitions - Centrally
scheduled backups are stored in <NETBIOS>\<BACKUP DEFINITION ID> folders.
{A7D12C32-10DD-48D1-BE06-EF0E9412480A} - Sales Team
{96D60D41-B0D9-4FF4-B562-BBF11F4290F8} - Support Team
{8A25D491-5DE7-41AE-9E91-AEDD51304A42} - Server Backups
{8CABEE54-267F-481D-BD18-55ECA7E1E80F} - this office
{8E6FB6D3-F8B7-432E-BBBC-1D188702D23A} - Servers
```

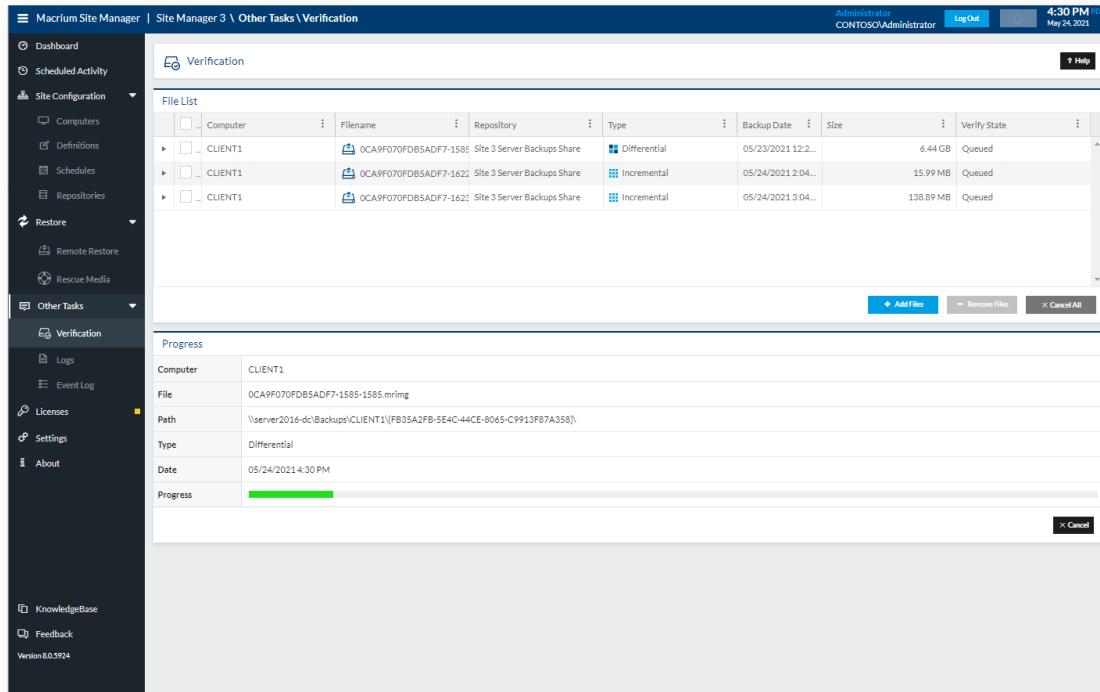

This lists all backup definition IDs and links them to the name of backup definitions. The reason this is done is so that changing a backup definition name doesn't cause the repository layout to change or a backup set to break because it's stored in a different folder

If a backup definition has been deleted, it will be removed from the information file but the folders and image files will remain in the repository. If you find a backup definition ID without a name in the information file, this is most likely a deleted definition

# Macrium Site Manager User Guide

## Verifying Images

Computer	Filename	Repository	Type	Backup Date	Size	Verify State
CLIENT1	0CA9F070FDB5ADF7-1585	Site 3 Server Backups Share	Differential	05/23/2021 12:2...	6.44 GB	Queued

# Macrium Site Manager User Guide

## Introduction

Rescue Media are live discs or USB sticks from which computers can boot directly into the Macrium Rescue Environment. This is a lightweight version of Windows (the Windows Preinstallation Environment or Windows PE) customised to include Reflect so users can manually recover computers which cannot boot Windows normally. Such computers are unable to run the Site Manager Agent; consequently, they can not be restored remotely.

Site Manager can create Rescue Media which can be downloaded through the Site Manager interface; giving users easy access to a centralized source of Rescue Media to recover failed agents.

Site Manager can create generic Rescue Media or Rescue Media which is targeted for a managed computer. Generic Rescue Media only contain the Macrium Rescue Environment and will be compatible with most machines with dynamic network settings. Agent Rescue Media includes driver and network information from the agent; it should be used for computers with static network settings or hardware not supported by Windows PE.

For advanced needs, use a copy of Reflect on a managed computer or the Site Manager server to create Rescue Media manually. See [Restoring an Image Through Macrium Reflect](#) for further information.

## Rescue Media Types

### Agent Rescue Media

Site Manager can create Rescue Media which is custom built for a particular agent to minimise the manual configuration required to restore it. Agent Rescue Media will be based off the right version of Windows PE for the target agent and contain copies of hardware drivers for devices which the agent detects as being unsupported by Windows PE. These devices can then be used in the Rescue Environment even if they are not supported in Windows PE by default. An up-to-date set of agent drivers are stored on a database on the Site Manager so that Agent Rescue Media can be created for failed agents at the time of need.

Agent network configurations are also stored in the Rescue Media so that the backup repository can be easily accessed through the Rescue Environment. Note that network settings must be configured manually within the Rescue Environment if the agent is restored to different hardware as network configurations are associated with a MAC address.

### Generic Rescue Media

Site Manager can also create Generic Rescue Media which does not target any single agent. These media will not include any extra drivers but users can manually specify drivers to be included in Rescue Media for a given Windows PE configuration (see below). Such rescue media will be appropriate for use on agents with common hardware configuration.

Network settings for all agents are stored in Generic Rescue Media. Appropriate network settings are selected when an agent boot the Rescue Environment from the Rescue Media. Note that network configuration selection is determined by MAC address so network settings may not be configured automatically if agent hardware has changed.

# Macrium Site Manager User Guide

## Universal Rescue Media

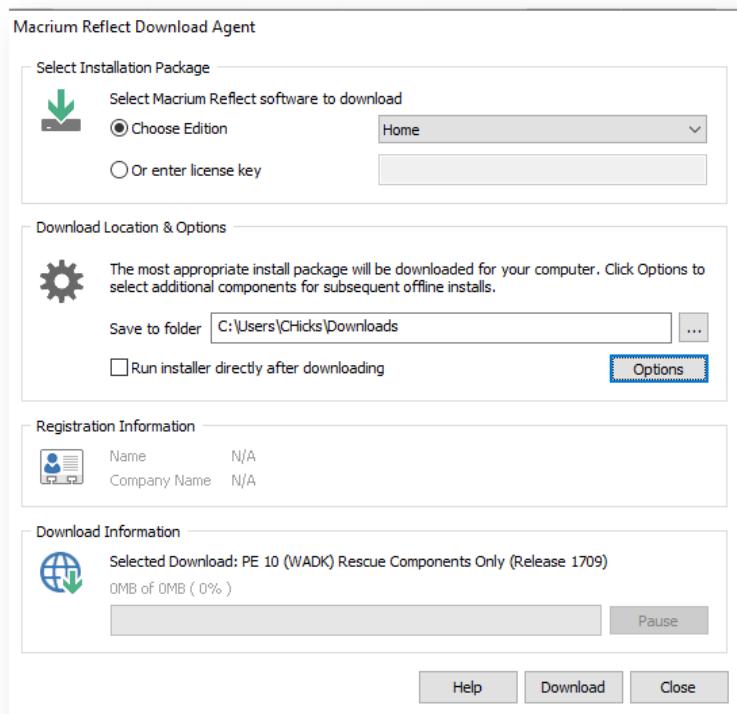

Universal rescue media contain all versions of Generic Rescue Media on a single bootable disk. This can be used to restore groups of computers which run different versions of Windows without creating the necessary Generic Rescue Media individually. Drivers for generic rescue media will also be included in Universal Rescue Media and will be loaded with the corresponding version of Windows PE.

## Windows PE

Site Manager Rescue Media are based off one of four Windows PE configurations. Windows PE for Windows 10 is suitable for use on computers running Windows 8 and later and Windows PE 3.1 should be used for Windows 7, Vista and XP. There is also support for 32-bit and 64-bit processors for each Windows PE version.

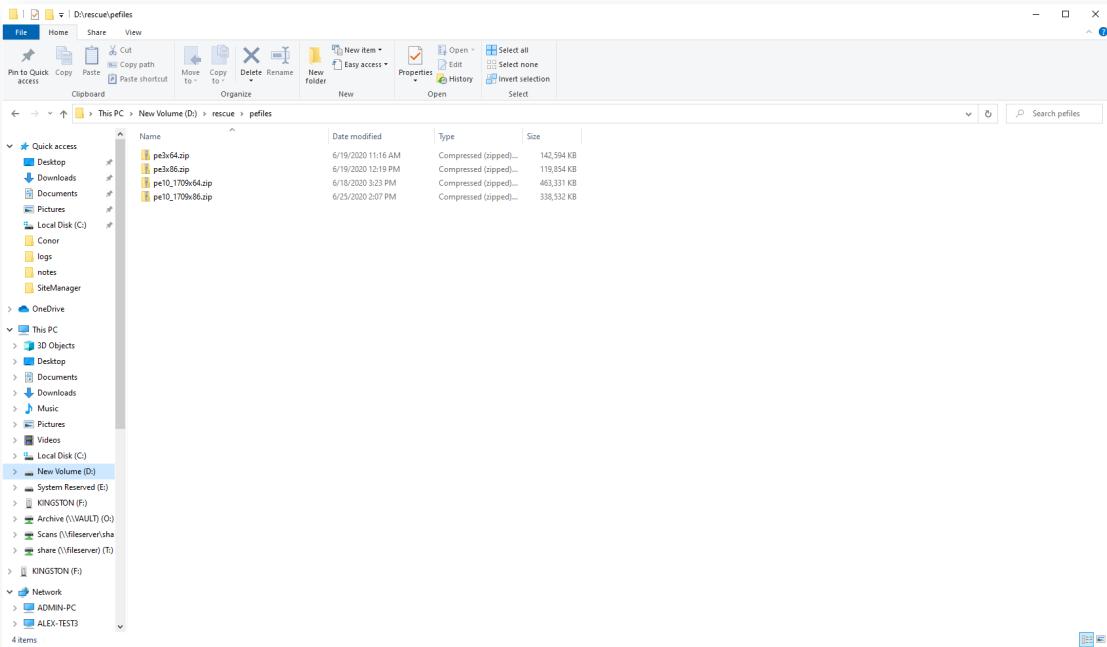

Windows PE files are downloaded when creating Rescue Media or performing agent restores and are stored for future use in the Rescue Media Working Directory (see below). This requires an active internet connection to download Windows PE from Microsoft.

## Creating Rescue Media Offline

Rescue Media and restore operations can continue in networks without internet access if the Windows PE files were previously downloaded using the Reflect Download Tool as seen above. Click **options** to select the version of Windows PE to download (Site Manager only supports Windows PE 10 and Windows PE 3).

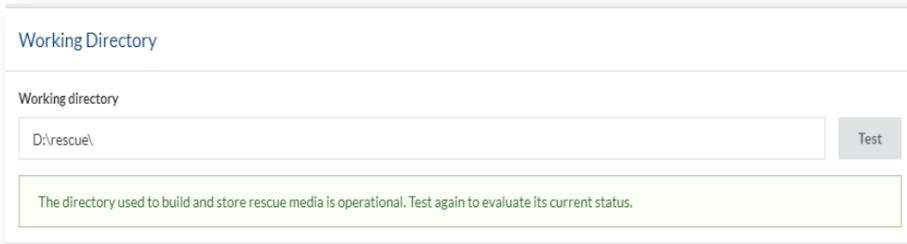

# Macrium Site Manager User Guide

These files should then be placed into **\pefiles** subfolder within the Rescue Media Working Directory without changing the name of the zip; it may be necessary to create the pefiles folder manually.

## Managing Rescue Media

### Rescue Media Working Directory

The Rescue Media Working Directory will contain the Rescue Media images, Windows PE files downloaded from Microsoft and device drivers extracted from the driver database. Rescue Media are a few hundred MB so this folder can grow large if several media are created (this is one reason why it is advised to create Rescue Media only at the time of need).

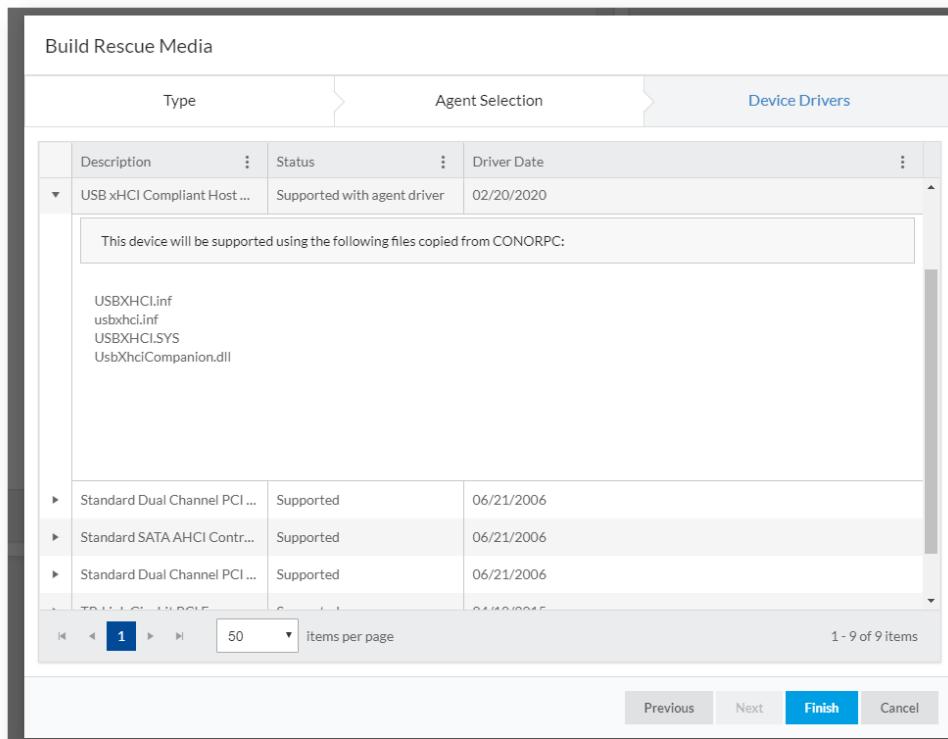

Consequently, users may want this directory to be on a drive with spare space and this can be set in the Rescue Media Settings. Before saving the setting, Site Manager will test the suitability of the folder by creating a small file which is deleted immediately; the save will fail if an error occurs during this process. There is no automatic cleanup of the previous working directory to avoid erasing custom driver files.

Note that the tools used to build Rescue Media require the working directory to be on an NTFS formatted drive, local to the Site Manager server.

# Macrium Site Manager User Guide

## Drivers

Drivers for agent hardware which is not already compatible with Windows PE will be copied to the Site Manager server and stored in a database (“drivers.db” in the Site Manager data directory). Site Manager automatically requests new drivers from agents if a hardware change is detected and drivers of removed computers will be deleted from the database.

Agent Rescue Media copy drivers required by the target agent. These drivers are displayed in the Rescue Media Build Wizard (above).

# Macrium Site Manager User Guide

Agent drivers can be exported from Site Manager databases into the rescue media working directory for manual management.

Group extracted drivers by agent rescue media configuration.

Export all Drivers   Export Drivers

Users can choose to extract the drivers from the database using the table on the Rescue Media settings page or extract drivers from all agents at once. Driver export destinations depend on the name of the agent; drivers from, say, AGENT will be copied into the **drivers\exports\AGENT** subfolder in the Rescue Media working directory (this folder will be created automatically). Alternatively, the exported drivers can be grouped by the Windows PE configuration suitable for the respective agent, this is controlled by the checkbox. For example, if AGENT was a Windows 10 machine then drivers would be exported to **drivers\exports\PE10x64\AGENT**. This may help users prepare Generic Rescue Media for use on groups of similar agents.

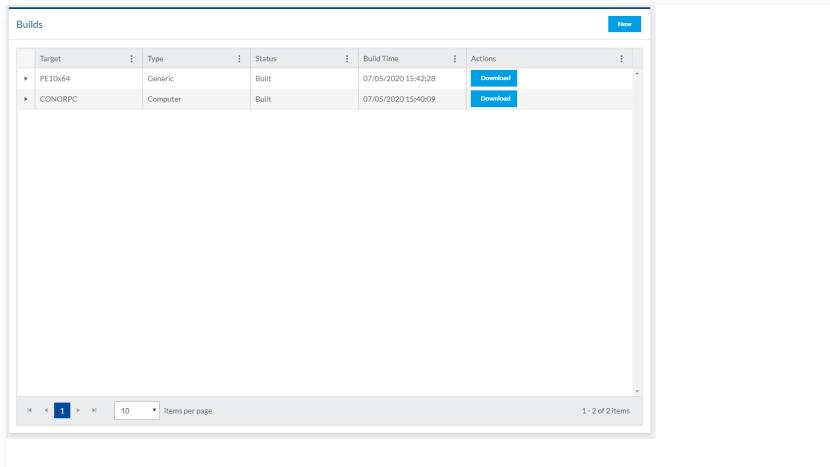

## ⓘ Management of Exported Drivers

Site Manager does not clear the contents of the export folder between exports - this may lead to old and new drivers existing in the same folder. We recommend users move drivers out of the export folder after export and clear the folder between exports.

Drivers which should be included in all Rescue Media for a given Windows PE configuration should be placed in a subfolder named after the configuration (e.g. **drivers\PE10x64**). These drivers will be included in both generic and agent Rescue Media which are based on the corresponding Windows PE configuration.

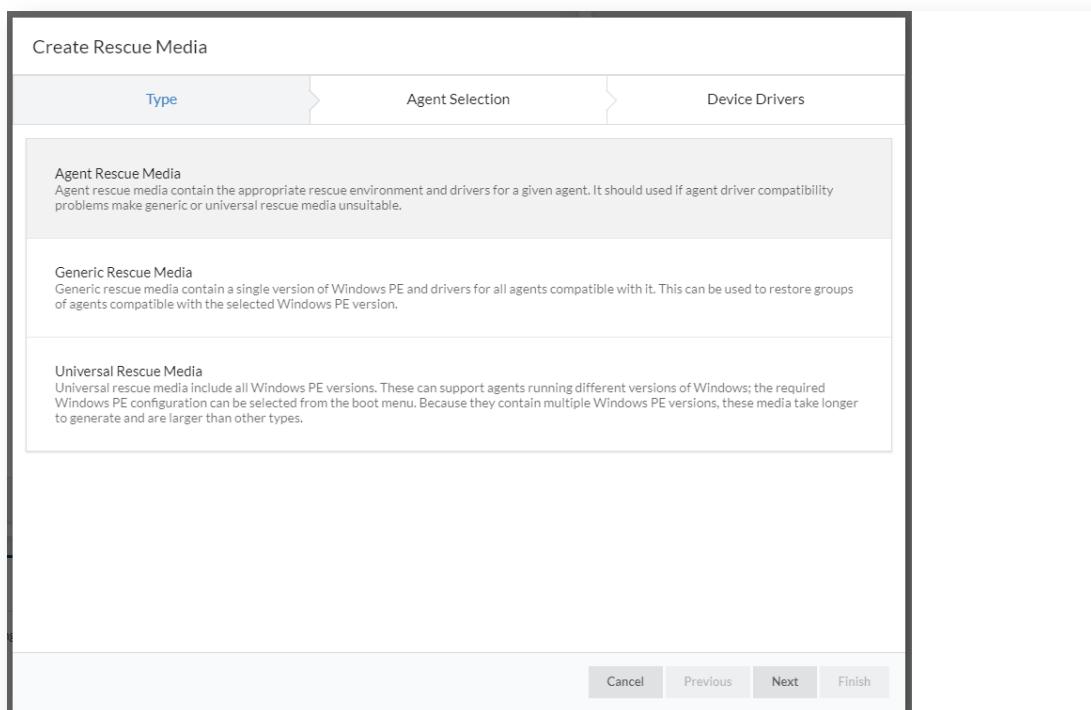

# Macrium Site Manager User Guide

## Creating Rescue Media

Target	Type	Status	Build Time	Actions
PE10x64	Generic	Built	07/05/2020 15:42:28	<a href="#">Download</a>
CONORPC	Computer	Built	07/05/2020 15:40:09	<a href="#">Download</a>

Rescue Media are created through a wizard on the Rescue Media page, accessed by clicking on the “New” button above the table.

**Create Rescue Media**

Type Agent Selection Device Drivers

**Agent Rescue Media**  
Agent rescue media contain the appropriate rescue environment and drivers for a given agent. It should be used if agent driver compatibility problems make generic or universal rescue media unsuitable.

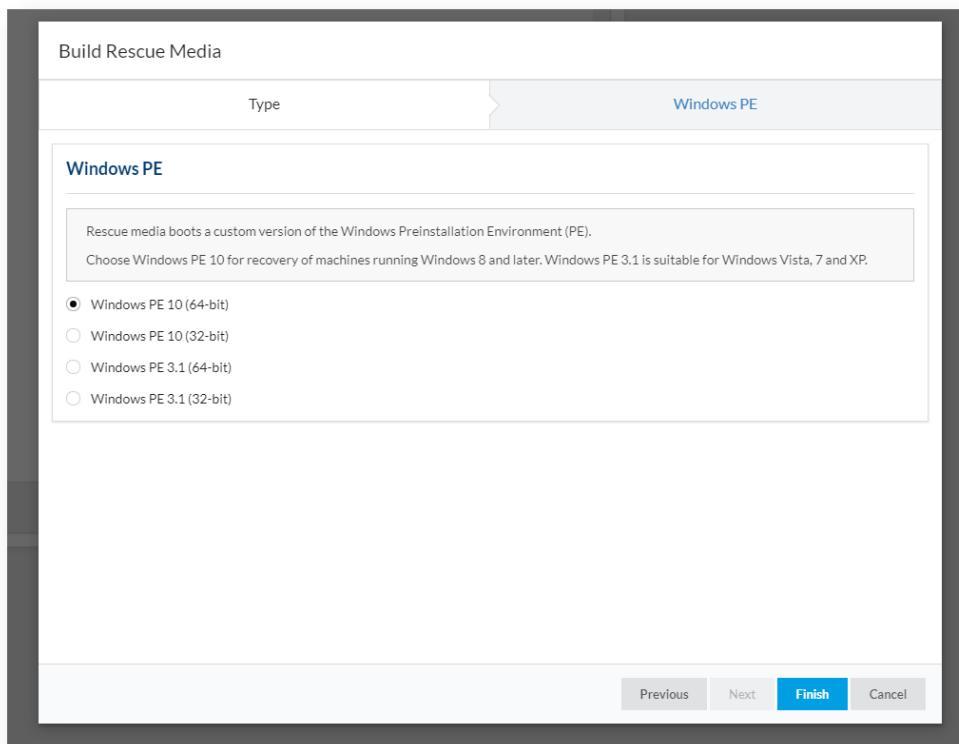

**Generic Rescue Media**  
Generic rescue media contain a single version of Windows PE and drivers for all agents compatible with it. This can be used to restore groups of agents compatible with the selected Windows PE version.

**Universal Rescue Media**  
Universal rescue media include all Windows PE versions. These can support agents running different versions of Windows; the required Windows PE configuration can be selected from the boot menu. Because they contain multiple Windows PE versions, these media take longer to generate and are larger than other types.

Cancel Previous Next Finish

A choice between building generic and agent Rescue Media is immediately presented. Generic Rescue Media should be created for restoring non-agent computers or computers without specialized hardware or network needs. Agent Rescue Media will be configured for the target computer.

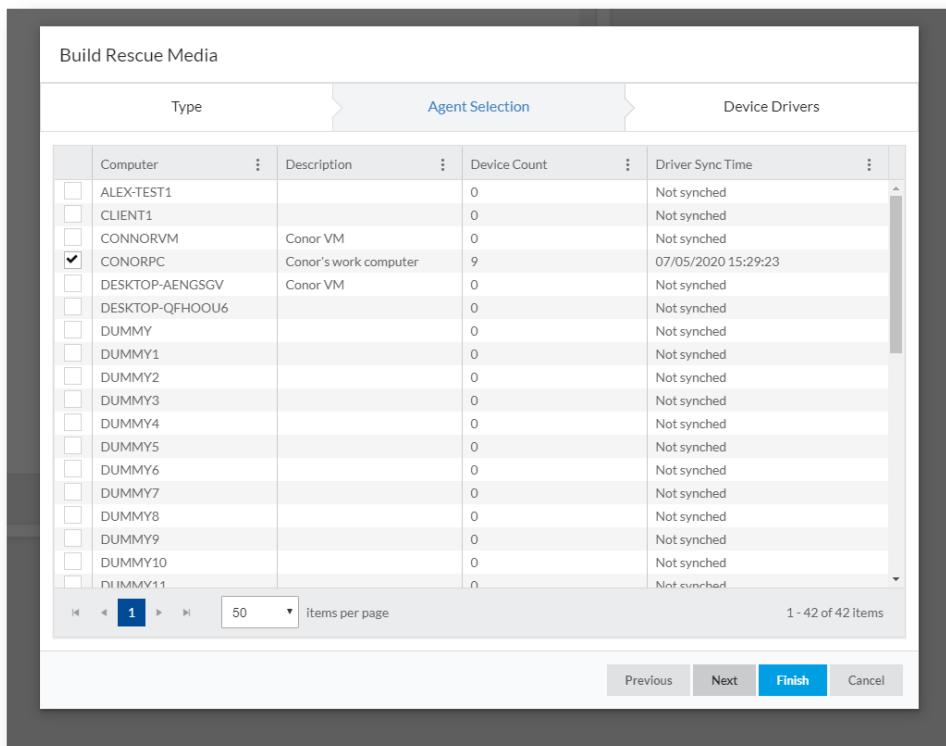

# Macrium Site Manager User Guide

The generic Rescue Media build pathway continues with a selection of Windows PE versions which the medium will be based upon. The tools which Reflect relies upon varies between Windows PE versions so it is important to choose the right version for the operating systems the media may target. Use the following table as a reference:

<b>Windows version of the target computer</b>	<b>Architecture of the target computer</b>	<b>Rescue Media configuration</b>
Windows 10, Windows 8.1, Windows 8	x64	PE10x64
	x86	PE10x86
Windows XP, Windows Vista, Windows 7	x64	PE3x64
	x86	PE3x86

Previous Next **Finish** Cancel

# Macrium Site Manager User Guide

Device and driver information for the selected computer is displayed in the final page of the sequence. The hardware is categorized as either supported in Windows PE by default, supported by drivers from the agent or not supported at all (in this uncommon case a driver will need to be supplied manually). Expanding a device will list the driver files (if any) to be included in the rescue medium.

Builds in progress will be listed in the Rescue Media table with a status of "Building". Details on the progress of the build and any errors can be displayed by expanding the row. The build can be cancelled but this may not have immediate effect as some stages of the build process can not be interrupted or there may be terminal steps to stop the build cleanly.

Computer	Status	Last Built	Download
CONORPC	Built	07/05/2020 15:40:09	
Version	7.2.9999		
Build time	07/05/2020 15:40:09		
Size	416.69MB		
File Name	computer-CONORPC.iso		Copy Path
Rebuild		Delete	

Built Rescue Media can be rebuilt by clicking on the "Rebuild" button which appears when the row is expanded. This is useful for updating Rescue Media when there has been changes in agent hardware. Further details of the build and a deletion option are also shown in the expanded view.

## Using Rescue Media

Rescue Media are stored as ISO image files in the Rescue Media working directory on the Site Manager server and can be downloaded by users logged into Site Manager. The image can be burned onto a disc or used to create a bootable USB stick which can be inserted into the target computer to load the rescue environment.

It is not necessary to create agent Rescue Media before it is needed. Agent drivers and network configurations are transferred to the Site Manager server during normal Agent communications so the server can generate Rescue Media for an agent even if that computer is offline. Storing Rescue Media for all agents ahead of time may be a significant storage burden.

Rescue Media for the Site Manager server should be created ahead of time and stored on another system so that Rescue Media capabilities can be retained in disaster scenarios.

## Rescue USB Tool

Rescue media can be loaded onto USB flash drives to create rescue USB sticks. Drivers can be copied onto rescue USB media after it has been created as the root of the USB is included in the driver load process. USB rescue media may then be the best choice when recovering from hardware failure or restoring older operating systems where the drivers may not have been added automatically, because drivers on these media can be continually updated to support recovery needs.

This flexibility means that rescue USB sticks are particularly suited for loading universal rescue media; drivers can be added as needed to support the set of computers the medium is intended for.

## Macrium Site Manager User Guide

However, some third party flashing tools are incompatible with Macrium rescue images. Therefore, Macrium has developed a tool to create rescue USB sticks from rescue media images created by Site Manager 8.

This tool has a command line interface and supports the following commands:

Command	Shortcut	Description
--help	-h	Prints help and copyright information
--list-devices	-l	Lists USB devices suitable for use as rescue sticks
--create	-c	Creates the rescue USB stick. Takes the path to the iso file (-i) and a device number (-d) as mandatory arguments. -f and -q are optional arguments to suppress confirmation prompt and progress output respectively.

USB rescue stick creation begins by listing compatible USB devices with the --list-devices command. The tool will search for suitable devices and print their details in the console. This will display device numbers which are used to specify which device this tool should target.

The rescue USB stick will be created with the --create command. The path to the iso file containing the rescue media image and the target device number can respectively be used as the --iso and --device arguments to --create. A confirmation prompt may appear to confirm the selection because this process overwrites data already on the USB stick.

The optional parameters --force and --quiet are intended for use in non-interactive environments and are implied if the tool output is redirected into a file.

## Troubleshooting and Advanced Guides

This section contains a number of guides for advanced topics including troubleshooting and integration with other areas of technology.

- [Troubleshooting Agent Communications](#)

- [Site Manager Registry Keys](#)

## Troubleshooting Agent Communications

This section contains technical details of what technologies, firewall rules or other prerequisites are required to enable a Macrium Agent to communicate with the Site Manager server. This includes both normal communication and requirements for remote installation of the Agent.

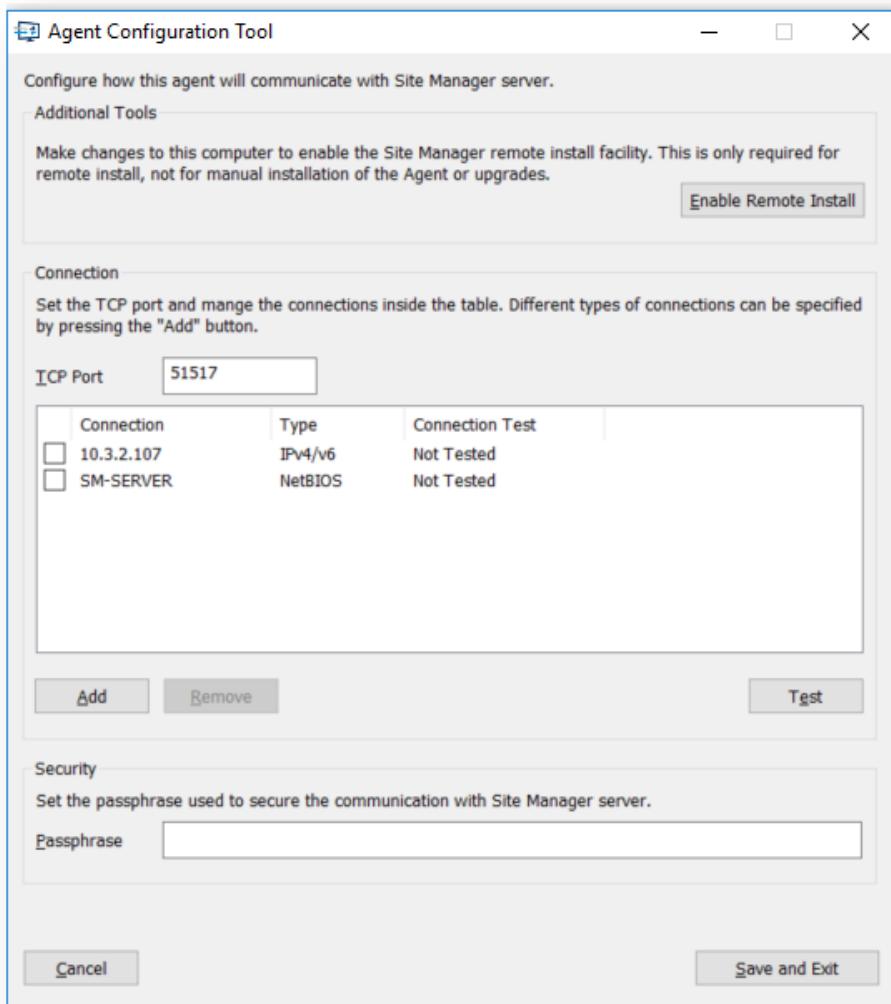

- Agent Configuration Tool
  - Enable Remote Install
  - Connections
    - TCP Port
    - Connection Methods
    - Test the Connection
- Agent Configuration Tool is not able to Connect
  - Incorrect Port
  - Failed Lookups
  - The firewall is blocking the connection
    - Site Manager
    - Site Manager Agent
- Enabling Remote Installation of the Agent on client computers
  - Computers connected to a domain
  - Computers not connected to a domain
    - Enable File Sharing
    - Enabling Remote Management Users

---

## Agent Configuration Tool

The Agent Configuration Tool is installed with the Macrium Site Manager server and remote agent.

# Macrium Site Manager User Guide

## Enable Remote Install

If *Enable Remote Install* is clicked, the tool will open firewall settings for File & Printer Sharing as well as enable local account token filter policy, which are described in the section below: [Enabling Remote Installation](#).

It is possible to enable the remote install via command line:

```
"C:\Program Files\Macrium\Agent\AgentConfigTool.exe" -SILENT_SETTING=YES -  
ENABLE_REMOTE_INSTALL=YES
```

## Connections

Site Manager and the agent use a TCP/IP connection in order to communicate.

# Macrium Site Manager User Guide

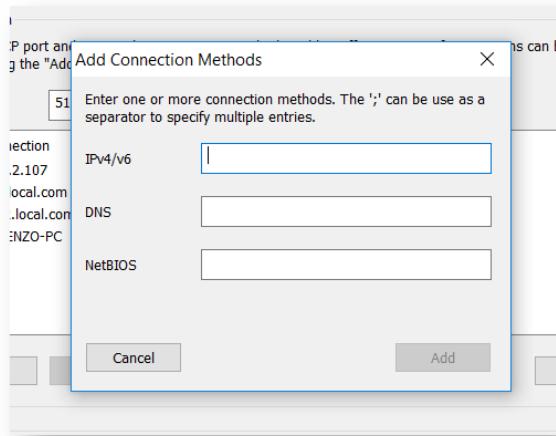

## TCP Port

This is the port used by Site Manager in order to accept an incoming TCP connection. This can be checked in the Site Manager settings page under Agent/Server Connection Details. Site Manager uses 51515 as default port.

## Connection Methods

The agent needs the IP (v4 or v6) of the machine that is running Site Manager. Alternatively, the agent will try to resolve to IP DNS names or the NetBIOS of the machine.

Click the *Add* button in order to add entries in the table.

## Test the Connection

By clicking the *Test* button the tool will attempt to connect to Site Manager with all the specified connection methods. The results of the test will be reported in the table.

Connection			
Set the TCP port and manage the connections inside the table. Different types of connections can be made by pressing the "Add" button.			
TCP Port	51515		
	Connection	Type	Connection Test
<input type="checkbox"/>	192.168.42.10	IPv4/v6	Successful
<input type="checkbox"/>	server2016-DC.CONT...	DNS	Failed
<input type="checkbox"/>	SERVER2016-DC	NetBIOS	Testing

If at least one test in the table is reported as *Successful* the agent will be able to connect to Site Manager.

If all the tests in the table are reported as *Failed* check the section below.

## Agent Configuration Tool is not able to Connect

If the connection tests in the table are reported as **Failed**, this may be due to a number of reasons:

### Incorrect Port

By default, Site Manager uses TCP port **51515** for communications. This can be changed in the Settings of Site Manager. Confirm that the TCP Port in both the test tool and the Site Manager server match.

### Failed Lookups

To connect DNS or NetBIOS names, the Configuration Tool/Agent performs name lookups to resolve the name to an IP address. This uses both DNS and Broadcast (LLMNR) lookups. To confirm that the lookups are working correctly, check the logs in **C:\ProgramData\Macrium\SiteManager\AgentConfigTool.log** or attempt to ping the names directly on a Windows command line.

### The firewall is blocking the connection

#### Site Manager

The firewall of the machine hosting Site Manager must allow incoming TCP connections on the port specified in Site Manager setting under Agent/Server Connection Details. Site Manager uses 51515 as default port.

#### Site Manager Agent

The firewall must allow outbound TCP traffic.

---

## Enabling Remote Installation of the Agent on client computers

### Computers connected to a domain

Site Manager's remote install mechanism uses 'File and Print Sharing' to perform remote installation. On most domains, this is enabled by default on all domain joined computers. If there are additional restrictions on the network, remote installation will not work.

### Computers not connected to a domain

Non-domain networks require additional steps to enable the appropriate services and functions required to remote install the Macrium Agent. Each client computer must be configured with the steps below to allow remote installation.

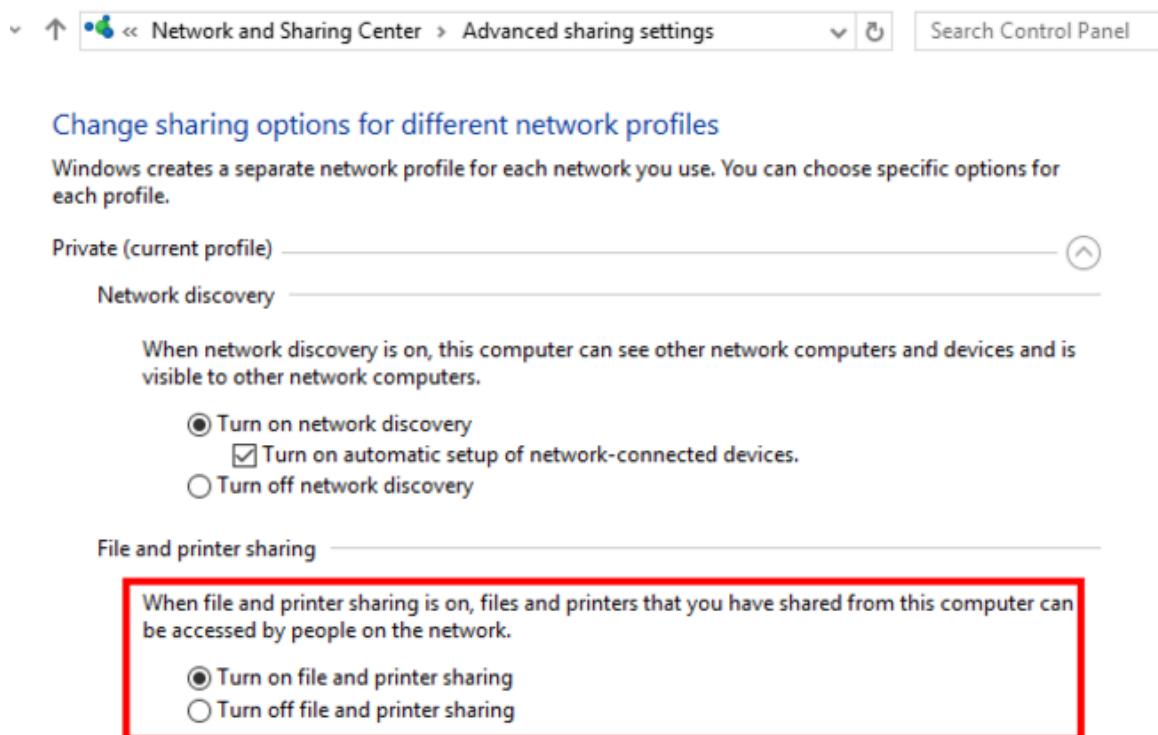

These additional steps are only required for remote agent installation. If the agent is installed manually, these steps are not required.

Note that these steps are not required to manually install the Macrium Agent.

# Macrium Site Manager User Guide

## Enable File Sharing

In order to perform the install, file and printer sharing must be turned on. This is found in the Network and Sharing Center -> Advanced sharing settings as shown below.

The screenshot shows the Windows Control Panel's Network and Sharing Center. Under 'Advanced sharing settings', the 'File and printer sharing' section is highlighted with a red box. Inside this box, the 'Turn on file and printer sharing' radio button is selected. The 'Turn off file and printer sharing' radio button is also visible.

**Change sharing options for different network profiles**

Windows creates a separate network profile for each network you use. You can choose specific options for each profile.

Private (current profile)

Network discovery

When network discovery is on, this computer can see other network computers and devices and is visible to other network computers.

Turn on network discovery  
 Turn on automatic setup of network-connected devices.  
 Turn off network discovery

File and printer sharing

When file and printer sharing is on, files and printers that you have shared from this computer can be accessed by people on the network.

Turn on file and printer sharing  
 Turn off file and printer sharing

## Enabling Remote Management Users

Outside a domain, users connecting to a computer remotely have reduced privileges. This is part of built-in Windows security measures. The reduced privileges mean that Local Administrator accounts do not have sufficient privileges to install the Macrium Agent when connecting remotely.

To allow remote users to connect with their full Administrator privileges, the following registry entry must be set on the client computer:

Key	HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System
Name	LocalAccountTokenFilterPolicy
Type	DWORD
Value	1

See <https://support.microsoft.com/en-us/kb/951016> for more information on this registry setting.

## Deploying Site Manager Agents Using SCCM

Deploying the Macrium Site Manager Agent service to manage your networked computers is easily performed using Site Manager's remote installation feature, however, for some organisations, Microsoft System Center is the preferred method for deploying MSI files. This guide will walk you through the process of deploying the Agent MSI using the Microsoft System Center Configuration Manager.

The Agent .msi is available in two different architectures.:

32 Bit	macrium_agent_x86.msi
64 Bit	macrium_agent_x64.msi

A separate deployment is required for each architecture.

## Command Line Switches

There are command line switches that can be passed to install the Agent MSI files.

<b>SILENT_SETTINGS=YES</b>	If not specified or if not equal to <b>YES</b> , launch the Agent Configuration Tool after the install
<b>ENABLE_REMOTE_INSTALL=YES</b>	If specified and equal to <b>YES</b> enable remote install, see <a href="#">Enabling Remote Installation</a>
<b>NOSHORTCUT=YES</b>	If specified and equal to <b>YES</b> the installer will not create a shortcut, if equal to <b>NO</b> , shortcuts will be installed
<b>ACCESTOKEN=<i>passphrase</i></b>	If specified the installer will set the passphrase
<b>SET_ALL=YES</b>	If specified and equal to <b>YES</b> , override IP, DNS and NetBIOS if they are empty
<b>SERVER_IP=192.168.10.42;192.168.10.43</b>	If specified and not empty set Site Manager IP in the agent. If <b>SET_ALL=YES</b> and an empty IP is provided, the empty IP will override the current IP
<b>SERVER_DNS=sitemanger1.contoso.local;sitemanger2.contoso.local</b>	If specified and not empty set Site Manager DNS name in the agent. If <b>SET_ALL=YES</b> and an empty DNS is provided, the empty DNS will override the current DNS

# Macrium Site Manager User Guide

<b>SERVER_NETBIOS=SERVER- NETBIOS</b>	If specified and not empty set Site Manager NetBIOS name in the agent. If SET_ALL=YES and an empty NetBIOS is provided, the empty NetBIOS will override the current NetBIOS
<b>NOCBT=YES</b>	If specified and equal to <b>YES</b> , the CBT driver will not be installed
<b>CBT=YES</b>	If specified and equal to <b>YES</b> , the CBT driver will be installed

If the shortcut and CBT switches are not specified at all, the shortcut and CBT features will be installed unless an older version of the Site Manager Agent is installed, in which case it will follow the settings of the existing install.

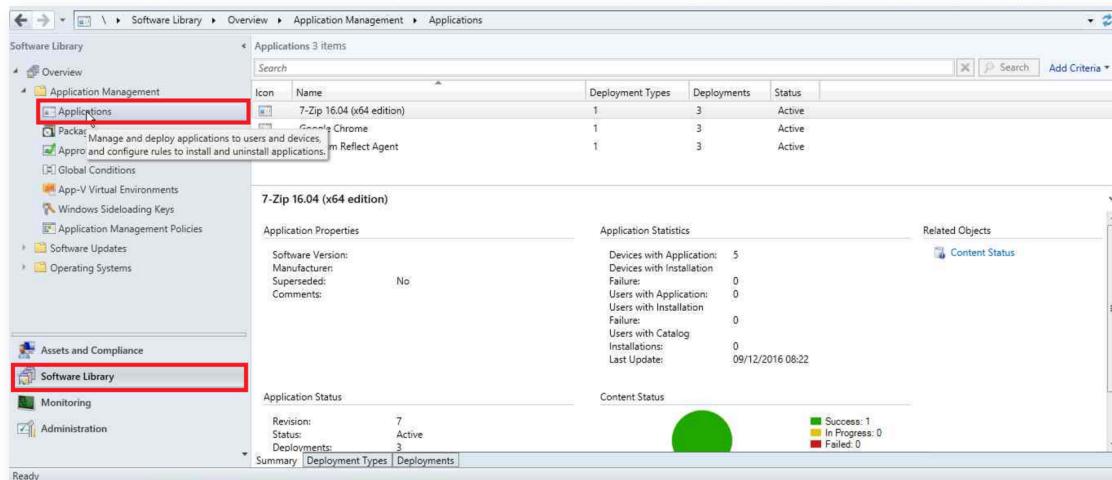

Some platforms cannot run CBT, on these platforms the CBT switch has no effect.

## Licensing

Licenses for connected computers are automatically applied when the computer is added to Site Manager. There are no licensing requirements when the Macrium Agent is deployed.

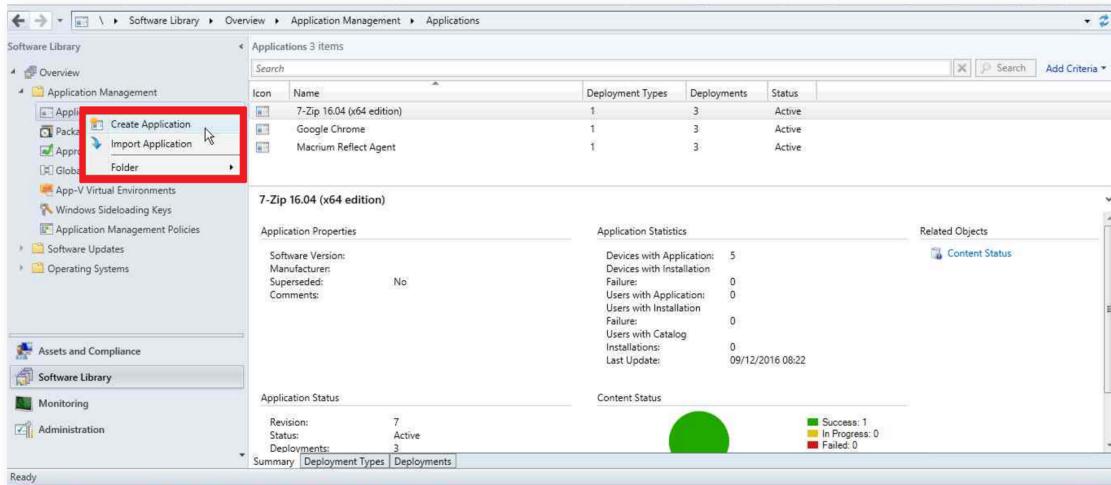

**Before you begin:** Microsoft System Center Configuration Manager must previously have been installed on Windows Server.

1. Open SCCM and navigate to '**Software Library**' > '**Applications**' menu on the left hand pane.

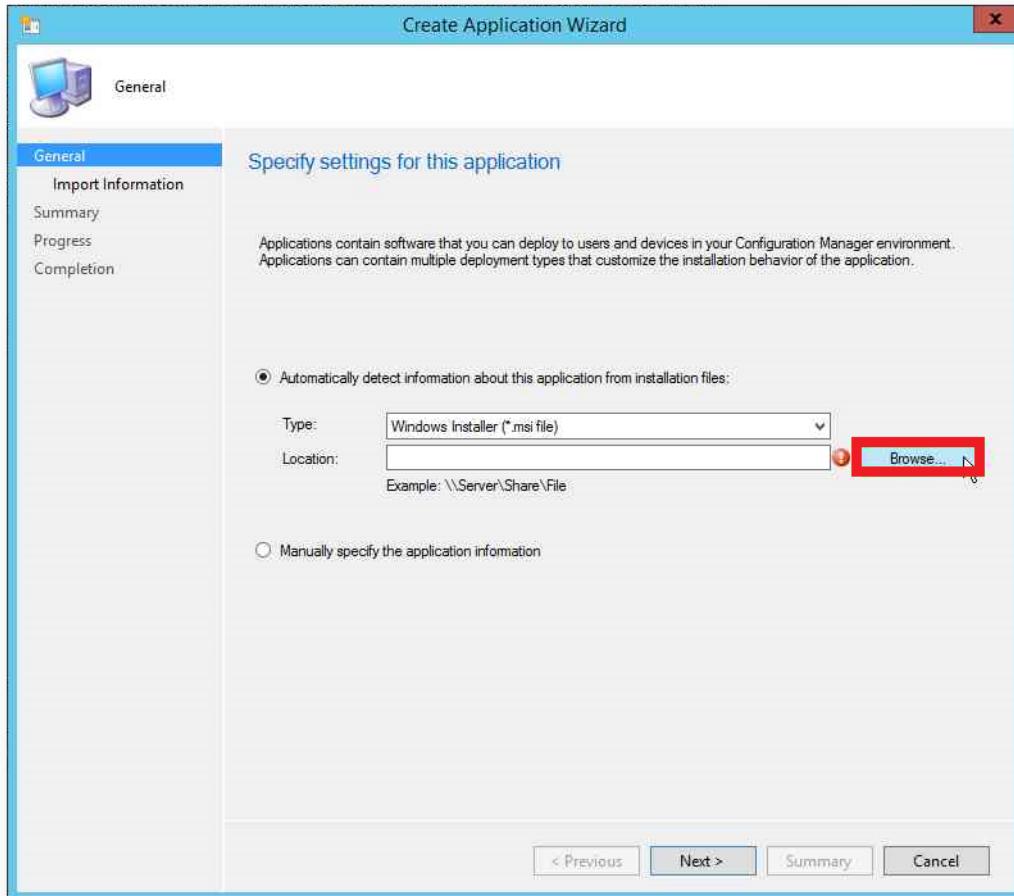

2. Right click the '**Applications**' menu and select '**Create Application**'.

# Macrium Site Manager User Guide

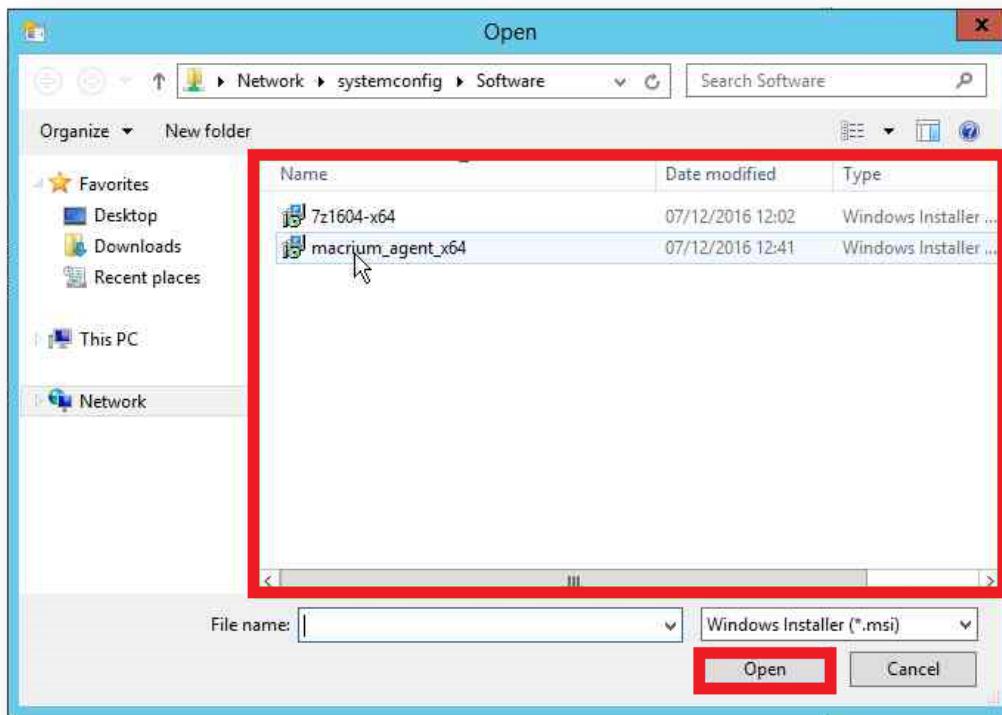

3. In the newly opened wizard click the 'Browse...' button to add the Macrium Agent to the wizard.

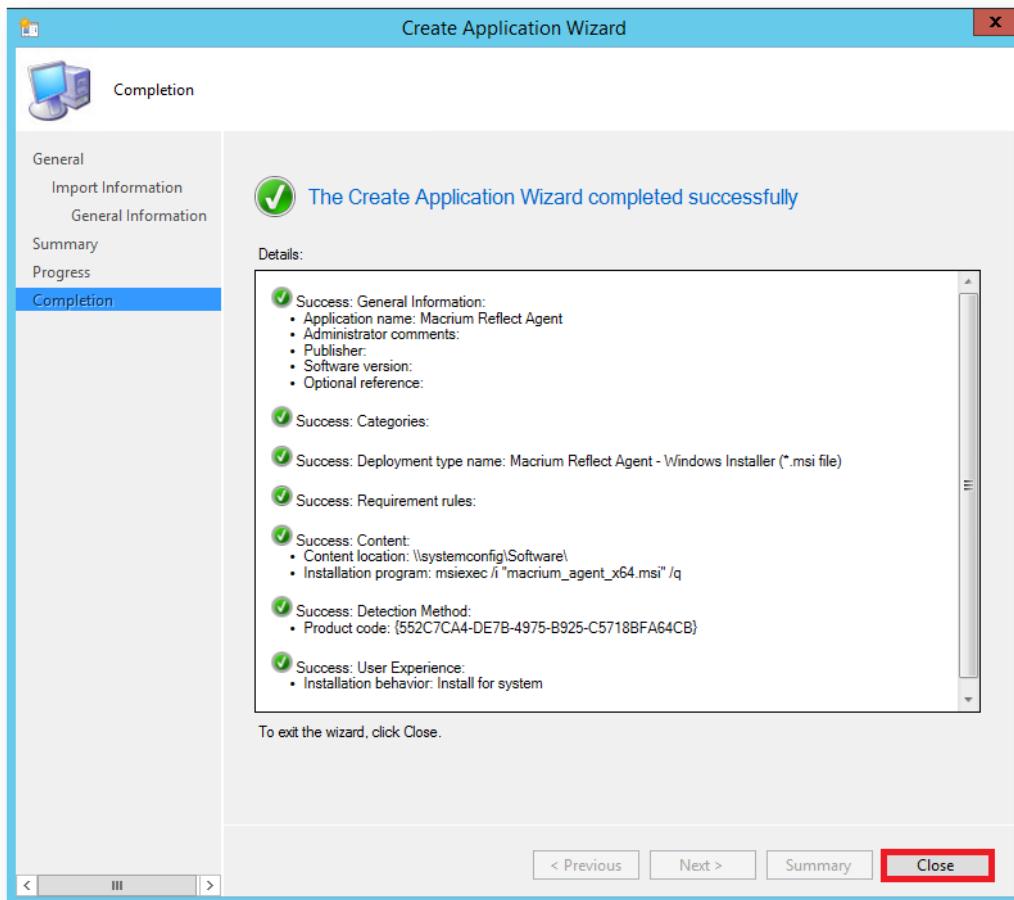

4. Find and select the Macrium Agent on your network or local disk then click 'Open'.

# Macrium Site Manager User Guide

5. Click 'Next' a few more times leaving the fields on each page as **default** until you see the page shown below and click 'Close'.

# Macrium Site Manager User Guide

- Once the 'Close' button is **clicked**, you can start deploying the **Macrium Agent** as per your companies SCCM deployment protocol.

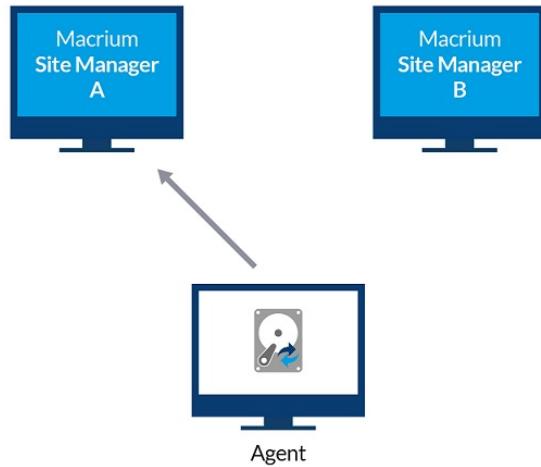

## Migrating Site Manager to a new Computer

- Overview
- Automated Agent Migration
- Export and Import Site Manager Configuration
- Manually Migrate a Fully Configured Site Manager

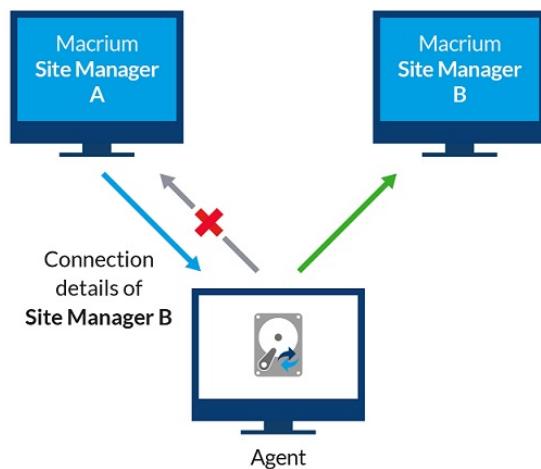

### Overview

Site Manager Agents initiate the connection to the Site Manager server which manages them. To move a Site Manager Agent to a new server, the settings in the Agent can be changed on the Agent, or performed using one of the processes listed in this article.

# Macrium Site Manager User Guide

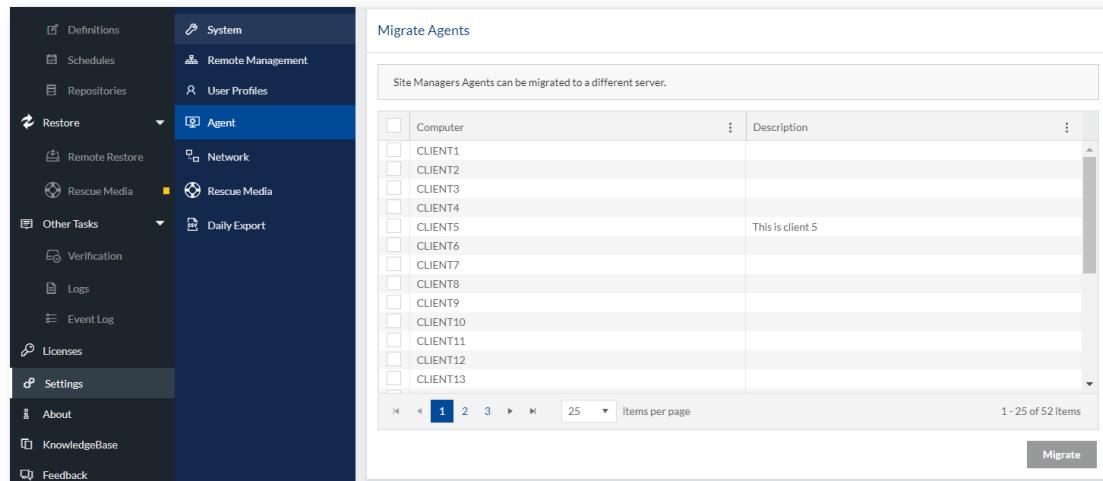

Site Manager A can automate the process of migrating Agents by passing the connection details of Site Manager B to a number of Agents.

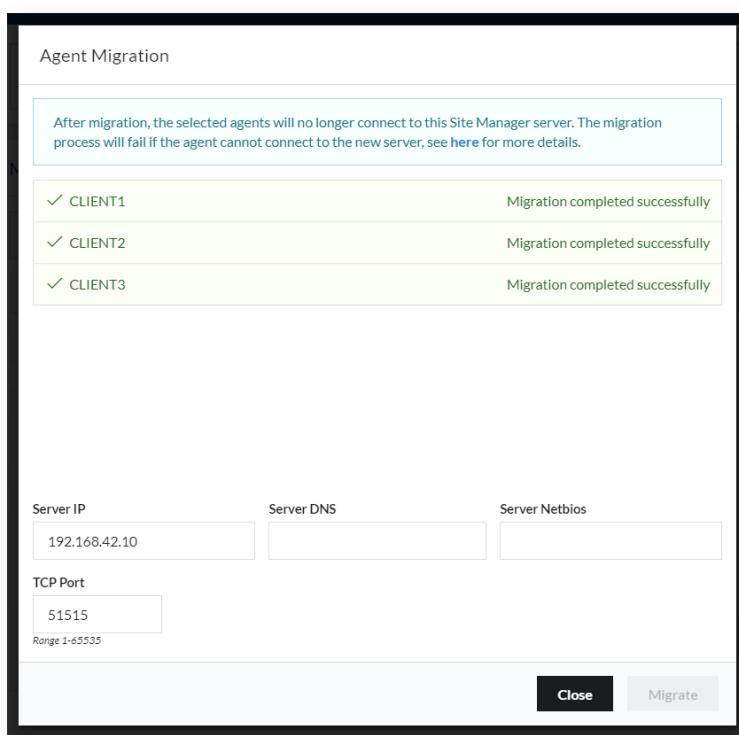

# Macrium Site Manager User Guide

## Automated Agent Migration

The screenshot shows the 'Migrate Agents' interface in Macrium Site Manager. The left sidebar is a navigation menu with various options like Definitions, Schedules, and Settings. The 'Settings' option is currently selected. The main panel is titled 'Migrate Agents' and contains a table with a list of agents. One agent, 'CLIENT5', has a note: 'This is client 5'. A 'Migrate' button is at the bottom right.

1. In order to migrate an agent from Site Manager A to Site Manager B
2. Go to Settings/Agent page of Site Manager A
3. Select the agents to migrate
4. Click the *Migrate* button
5. Add the connection details for Site Manager B
6. Click the *Migrate* button and wait for the results

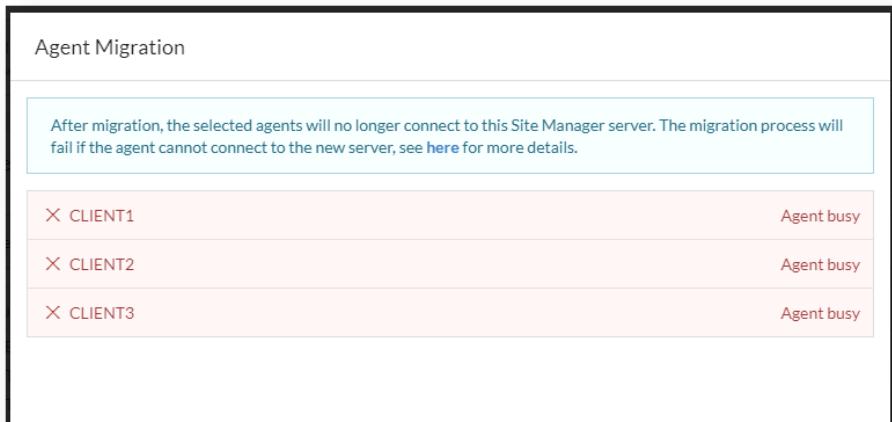

The screenshot shows the 'Agent Migration' dialog box. It displays a list of agents that have been successfully migrated. The agents listed are CLIENT1, CLIENT2, and CLIENT3, each with a checkmark and the note 'Migration completed successfully'. Below the list are fields for 'Server IP' (192.168.42.10), 'Server DNS', 'Server Netbios', 'TCP Port' (51515), and a note 'Range 1-65535'. At the bottom are 'Close' and 'Migrate' buttons.

# Macrium Site Manager User Guide

If the agent is able to connect to site Manager B, it will report the success and connect to site manager B (the agent will disconnect from Site manager A).

If the agent can't connect to site Manager B, it will report failure. In this case the agents were busy.

## Export and Import Site Manager Configuration

Site Manager 7.2 has a configuration import and export function. This should be used instead of the below manual procedure. To use the new mechanism, see [Configuration and Security](#)

This article should only be used in cases where an older Site Manager installation is involved or in the case of manual recovery if the Site Manager server hardware can no longer run.

## Manually Migration Migrate a Fully Configured Site Manager

1. **Install Site Manager** on a new computer; the download links can be found by [clicking here](#) or in trial/license purchase emails. Both the old and new Site Manager installation should be the same version
2. **Remove** any license keys from the old Site Manager installation. The keys must be added to the new Site Manager to register them with the new hardware
3. **Stop the 'Macrium Remote Management Service'** on the new computer from the **Services** snapin.  
Or run the following command from an elevated command prompt:

```
sc stop MacriumRemoteManagementService
```

4. If the **Macrium Agent** is installed on the new server, it should be stopped too. This can be done in the Services UI or by command line:

```
sc stop MacriumAgentService
```

5. From your old installation, **copy** the **SiteManager** folder located at '**C:\ProgramData\Macrium\**' to the new computer, overwriting the existing folder.

# Macrium Site Manager User Guide

6. If you are using an SSL certificate to provide an HTTPS interface, ensure that the certificate files are copied to the same path on the new computer. The default self-signed certificates supplied with Site Manager are installed in the ProgramData\SiteManager folder.
7. **Start the ' Macrium Remote Management Service'** on the new computer from the **Services** snapin.  
Or run the following command from an elevated command prompt

```
sc start MacriumRemoteManagementService
```

8. If the **Macrium Agent** is installed, it should be restarted too as above or by using the following command line:

```
sc start MacriumAgentService
```

9. Once the service starts, the new Site Manager installation should begin taking over the computers from the old server. The old server should be stopped before this happens. If an agent is in the "Managed by Another Server" state, it may be necessary to manually refresh the agent using the **Refresh** button.
10. If licenses were removed from the old server, add them to the new server.

Dashboard layout and table layouts are stored on a per-user basis. If the new computer uses different local administrator account names to the old, these layout customisations may be lost

## MultiSite Integration

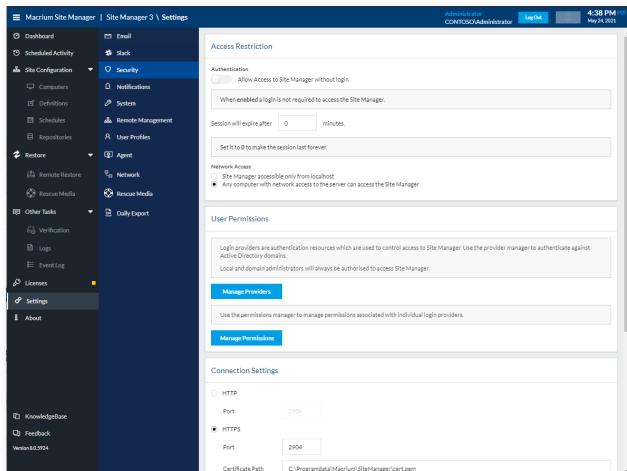

Macrium MultiSite allows multiple Site Manager installations to be monitored and managed from a single online portal. To find out more, visit our website at <https://www.macrium.com/multisite>

To configure Site Manager for MultiSite integration, the following steps must be followed.

## Security Configuration

To ensure that no security issues can arise as a result of enabling MultiSite Integration, the following security options must be set in the **Settings** page under **Security**:

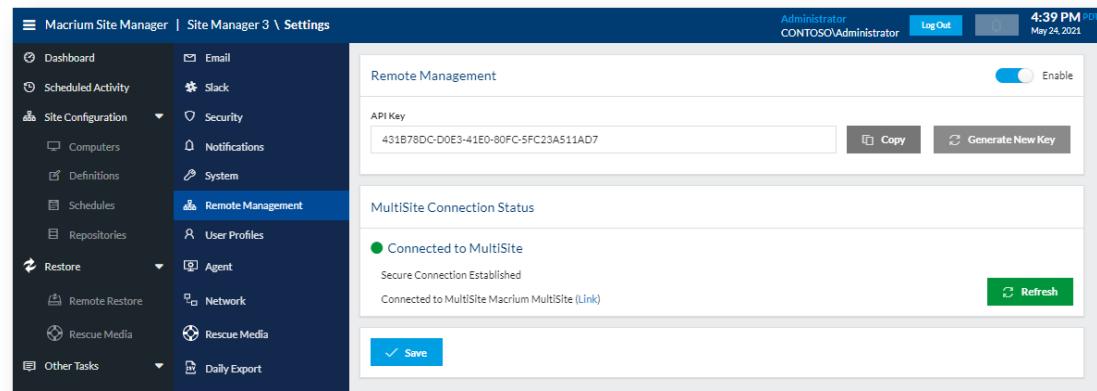

# Macrium Site Manager User Guide

Name	Required Setting
Access Restriction - Allow Access to Site Manager without login	Off - user login must be enabled
Access Restriction - Network Access	Any computer with network access to the server can access Site Manager
Connection Settings	HTTPS communication must be enabled
Connection Settings - Port	Any port may be used

## Remote Management

Remote management of Site Manager must be enabled in the **Remote Management** section of **Settings**.

The options available are:

# Macrium Site Manager User Guide

Option	Description
Enable	Toggles Remote Management access on and off
API Key	Security key required by MultiSite to access Site Manager remotely. If this key is changed, MultiSite access will fail until MultiSite is updated with the new key
Copy	Copies the API key to the clipboard
Generate New Key	Generates a new random key. The key is not in effect until <b>Save</b> is pressed

All communications between MultiSite and Site Manager use RSA 2048 encryption, no unencrypted data is transferred

## Communications Ports and IP Addresses

The MultiSite connection is based on outgoing traffic from the Site Manager installation.

Server	Protocol	Port	IP Addresses	Purpose
tunnel.msadmin.macrium.com	HTTPS	443	40.84.156.200 13.84.162.176 13.65.241.157	To establish an initial connection to MultiSite, Site Manager makes an outgoing HTTPS connection to the Macrium servers.
tunnel.msadmin.macrium.com	SSH	1004	40.84.156.200 13.84.162.176 13.65.241.157	Site Manager uses an outgoing SSH connection to transfer information to MultiSite. Please note that the port used may change in future releases

The IP addresses provided may be changed or added to in future releases. We recommend adding any necessary firewall rules by DNS name if possible.

## Agent User Scripting

- Overview
- Setting Up Scripting
  - Running the Script
  - Script output

# Macrium Site Manager User Guide

- Viewing Script Results
- Security

## Overview

As of version 7.1.3268, a user script may be placed on the agent which the agent will run periodically. This script can produce a user description which is displayed in the computers table of Site Manager and can be used to disable scheduled backups in Site Manager.

The intended use for this script is to provide a mechanism for user scripting to display useful information to the server such as asset IDs and other nonstandard information specific to each computer and to provide a mechanism for the Site Manager administrator to disable backups based on installation specific details. An example of this would be a script which detects that a laptop is connected to the network via a VPN and disables backups until the computer is back in the office.

## Setting Up Scripting

The Agent will look for a script at the path **C:\Program Files\Macrium\Agent\Scripts\script.cmd**

This script is executed as a Windows batch file/command script. Powershell scripts, executable files or any other sort of script may be called from this **script.cmd** file.

## Running the Script

The Agent will run the script and send the results to the Site Manager server under the following conditions:

- When the Macrium Agent service starts up
- When any file in the **C:\Program Files\Macrium\Agent\Scripts** folder changes
- When any value is written to the **HKEY\_LOCAL\_MACHINE\SOFTWARE\Macrium\CMCAgent\UserScripts** registry key
- Every 30 minutes

Script activity is logged in the **c:\programdata\Macrium\SiteManager\AgentUserScript.log** file

## Script output

The script should produce the following output:

- User description - any text outputted to standard out (e.g. with the 'echo' command) will be shown in Site Manager in the "User Description" column of the Computers table
- Operating Mode - the return code of the script determines the user-set operating mode of the agent. The following

Script Return Value	Operating Mode	Description
0	Normal	The Agent is running normally and all scheduled backups are being run

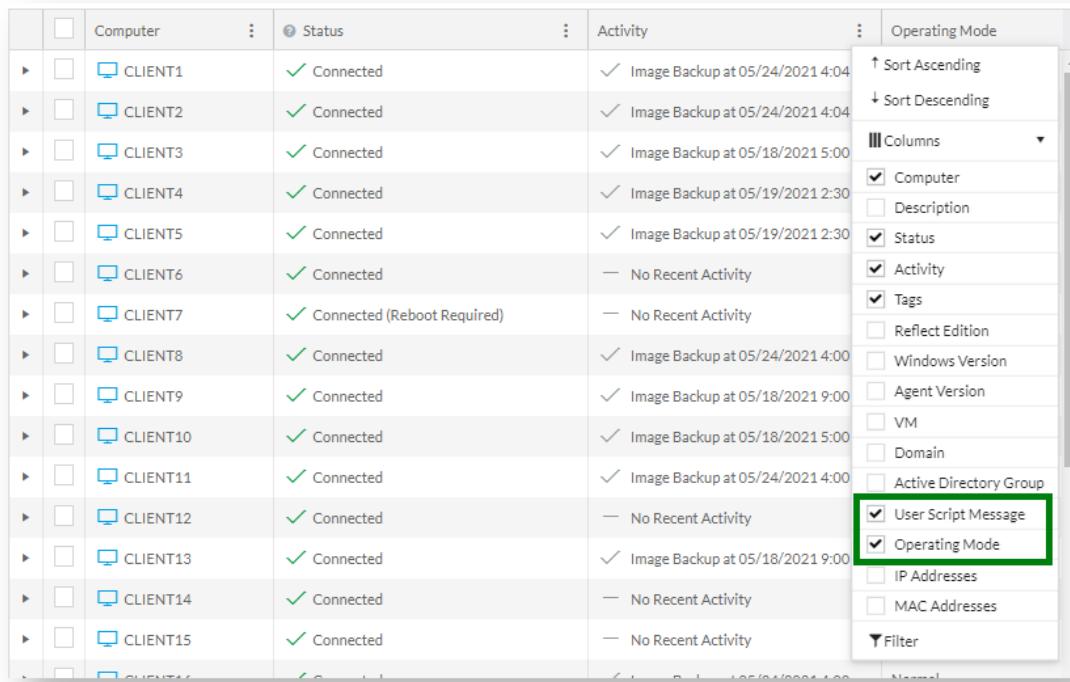

# Macrium Site Manager User Guide

Script Return Value	Operating Mode	Description
-1	Ignoring scheduled backups	<p>The Agent should not run backups. When this error code is returned, Site Manager will defer all scheduled backups for the agent until the user script starts returned normal status again.</p> <p>When the agent returns to normal status, any missed backups will be executed immediately as if the computer had been offline and <b>Defer Missed Backups</b> was set in the Site Manager schedule.</p> <p>This can be used for computers which move between networks and should not perform backups if they're connected over VPN or WiFi</p>
Any other value	Normal	Any other value is assumed to be an error code in the user script and the script execution is ignored

## Viewing Script Results

For debugging purposes, script activity is logged in **c:\programdata\Macrium\SiteManager\AgentUserScript.log** on the agent computer.

The results of the script execution can be shown in the Computers table in Site Manager by enabling the "User Script Message" and "Operating Mode" columns which are hidden by default:

The screenshot shows a table of 15 client computers. The columns are: Computer, Status, Activity, and Operating Mode. A context menu is open over the 'Operating Mode' column, listing various column options. The 'User Script Message' and 'Operating Mode' checkboxes are checked and highlighted with a green box, indicating they are being selected for display.

	Computer	Status	Activity	Operating Mode
▶	CLIENT1	✓ Connected	✓ Image Backup at 05/24/2021 4:04	
▶	CLIENT2	✓ Connected	✓ Image Backup at 05/24/2021 4:04	
▶	CLIENT3	✓ Connected	✓ Image Backup at 05/18/2021 5:00	
▶	CLIENT4	✓ Connected	✓ Image Backup at 05/19/2021 2:30	
▶	CLIENT5	✓ Connected	✓ Image Backup at 05/19/2021 2:30	
▶	CLIENT6	✓ Connected	— No Recent Activity	
▶	CLIENT7	✓ Connected (Reboot Required)	— No Recent Activity	
▶	CLIENT8	✓ Connected	✓ Image Backup at 05/24/2021 4:00	
▶	CLIENT9	✓ Connected	✓ Image Backup at 05/18/2021 9:00	
▶	CLIENT10	✓ Connected	✓ Image Backup at 05/18/2021 5:00	
▶	CLIENT11	✓ Connected	✓ Image Backup at 05/24/2021 4:00	
▶	CLIENT12	✓ Connected	— No Recent Activity	
▶	CLIENT13	✓ Connected	✓ Image Backup at 05/18/2021 9:00	
▶	CLIENT14	✓ Connected	— No Recent Activity	
▶	CLIENT15	✓ Connected	— No Recent Activity	

# Macrium Site Manager User Guide

These columns will show the script results:

Operating Mode	User Script Message
Normal	
Normal	
Ignoring Scheduled Backups	Example Custom Agent Status
Normal	
Normal	
Normal	
Normal	

This output was produced from the user script below:

```
script.cmd

@echo off
echo Example Custom Agent Status
exit -1
```

## Security

For security reasons, scripts must be placed in the **C:\Program Files\Macrium\Agent\Scripts** folder. This folder has write access to **Administrator** users only by default. If the permissions on this folder are manually changed by a system administrator, non-privileged users may be able to set or modify the script being run.

The Agent service runs the script as a non-privileged process using the **Network Service** account, regardless of what user the Agent service is configured to run as. This is to prevent any possibility of a user script being executed with Administrator privileges.

## Site Manager Advanced Communications Logging

Advance logging for agents can be enabled for Site Manager by adding the following registry key values.

This should be done only under the direction of Macrium Support.

This can affect performances as the Site Manager will be logging any interaction with the specified agents.

Remember to remove the added values once done.

1. Run *regedit*;
2. Go to *Computer\HKEY\_LOCAL\_MACHINE\SOFTWARE\Macrium\Site Manager*;

# Macrium Site Manager User Guide

3. Add a string (REG\_SZ) value;
4. Rename it to *AgentsToLog*;
5. Set the value to the NetBIOS of the agents separated by ';' e.g. "NETBIOS1;NETBIOS2; NETBIOS3";
6. Add a DWORD value;
7. Rename it to *LogLevel*;
8. Set the value to 3;
9. Restart Site Manager service;

## Site Manager Registry Keys

Some advanced options in Site Manager are exposed through setting registry keys on the Site Manager server. The available registry keys are:

<b>Key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\Macrium\Site Manager
<b>Value</b>	Connection Timeout
<b>Type</b>	DWORD
<b>Default</b>	480 (8 minutes)
<b>Affects</b>	Site Manager Server
<b>Description</b>	To avoid NAT routing causing TCP socket disconnection, Site Manager and the Agent will exchange keep alive messages on the interval set in this key. Lowering the number will cause more frequent network traffic, but may be necessary if a NAT router, gateway, switch or other network appliance is set to disconnect sockets more frequently than after 8 minutes idle.

<b>Key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\Macrium\Site Manager
<b>Value</b>	SSL Cipherlist
<b>Type</b>	String (REG_SZ)
<b>Default</b>	TLSv1+HIGH:!SSLv2:!DES:!3DES
<b>Affects</b>	Site Manager Server
<b>Description</b>	

# Macrium Site Manager User Guide

	<p>The SSL cipherlist controls which SSL/TLS encryption methods are allowed by the Site Manager's HTTPS management interface. If stricter limits are required for security, any OpenSSL cipherlist as documented <a href="#">on the OpenSSL website</a> may be used.</p> <p>For example, to restrict the web interface to TLS 1.2 and forbid MD5, SHA1 and RC4 hashing, the following string may be used: "TLSv1.2:HIGH:kRSA:!SHA1:!RC4:!MD5:!eNULL:!aNULL:!AES128"</p>
--	---

<b>Key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\Macrium\Site Manager
<b>Value</b>	Enable LDAPS
<b>Type</b>	DWORD
<b>Default</b>	1
<b>Affects</b>	Site Manager Server
<b>Description</b>	If set to 0, Site Manager will only attempt unencrypted LDAP requests to Active Directory servers. If set to 1, Site Manager will attempt LDAPS (LDAP over SSL) requests and only fall back to unencrypted requests on error.

<b>Key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\Macrium\Site Manager
<b>Value</b>	LDAPS Port
<b>Type</b>	DWORD
<b>Default</b>	636
<b>Affects</b>	Site Manager Server
<b>Description</b>	The TCP port number to attempt LDAPS queries on.

<b>Key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\Macrium\Site Manager
<b>Value</b>	LDAP Port
<b>Type</b>	DWORD

# Macrium Site Manager User Guide

<b>Default</b>	389
<b>Affects</b>	Site Manager Server
<b>Description</b>	The TCP port number to attempt LDAP queries on.
<b>Key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\Macrium\Site Manager
<b>Value</b>	Outgoing HTTP Disable
<b>Type</b>	DWORD
<b>Default</b>	0
<b>Affects</b>	Site Manager Server
<b>Description</b>	If set to a non-zero value, this will disable Site Manager's outgoing checks for licenses and updates. This can be useful to set in cases where a Site Manager which cannot contact the internet is experiencing long delays when attempting to add offline keys
<b>Key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\Macrium\Site Manager
<b>Value</b>	Outgoing HTTP Timeout
<b>Type</b>	DWORD
<b>Default</b>	5
<b>Affects</b>	Site Manager Server
<b>Description</b>	By default, there is a 5 second connection timeout on all outgoing HTTP/HTTPS checks from Site Manager. If this is a problem due to slow networking, the timeout can be increased by modifying this registry key
<b>Key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\Macrium\Site Manager
<b>Value</b>	Listen IP Address
<b>Type</b>	String (REG_SZ)

## Macrium Site Manager User Guide

<b>Default</b>	n/a
<b>Affects</b>	Site Manager Server
<b>Description</b>	Site Manager will listen on its web interface on either the loopback address (127.0.0.1) in restricted mode or on all addresses otherwise. If this registry key is set, the Site Manager web UI will only accept connections from the IP address in this key. This can be useful in advanced deployments where the UI should only be accessible from one network.
<b>Key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\Macrium\Site Manager
<b>Value</b>	Disable Default Admin Access
<b>Type</b>	DWORD
<b>Default</b>	0
<b>Affects</b>	Site Manager Server
<b>Description</b>	By default, Site Manager allows login from any Administrator account on the local computer or on the domain which the local computer is connected to. Setting this registry key to non-zero will disable this behavior and only allow users and groups which have been explicitly allowed access in the settings page of Site Manager access. This key should only be set after initial configuration of Site Manager is completed, to prevent accidental lockout.
